CALIFORNIA CULTIVATOR

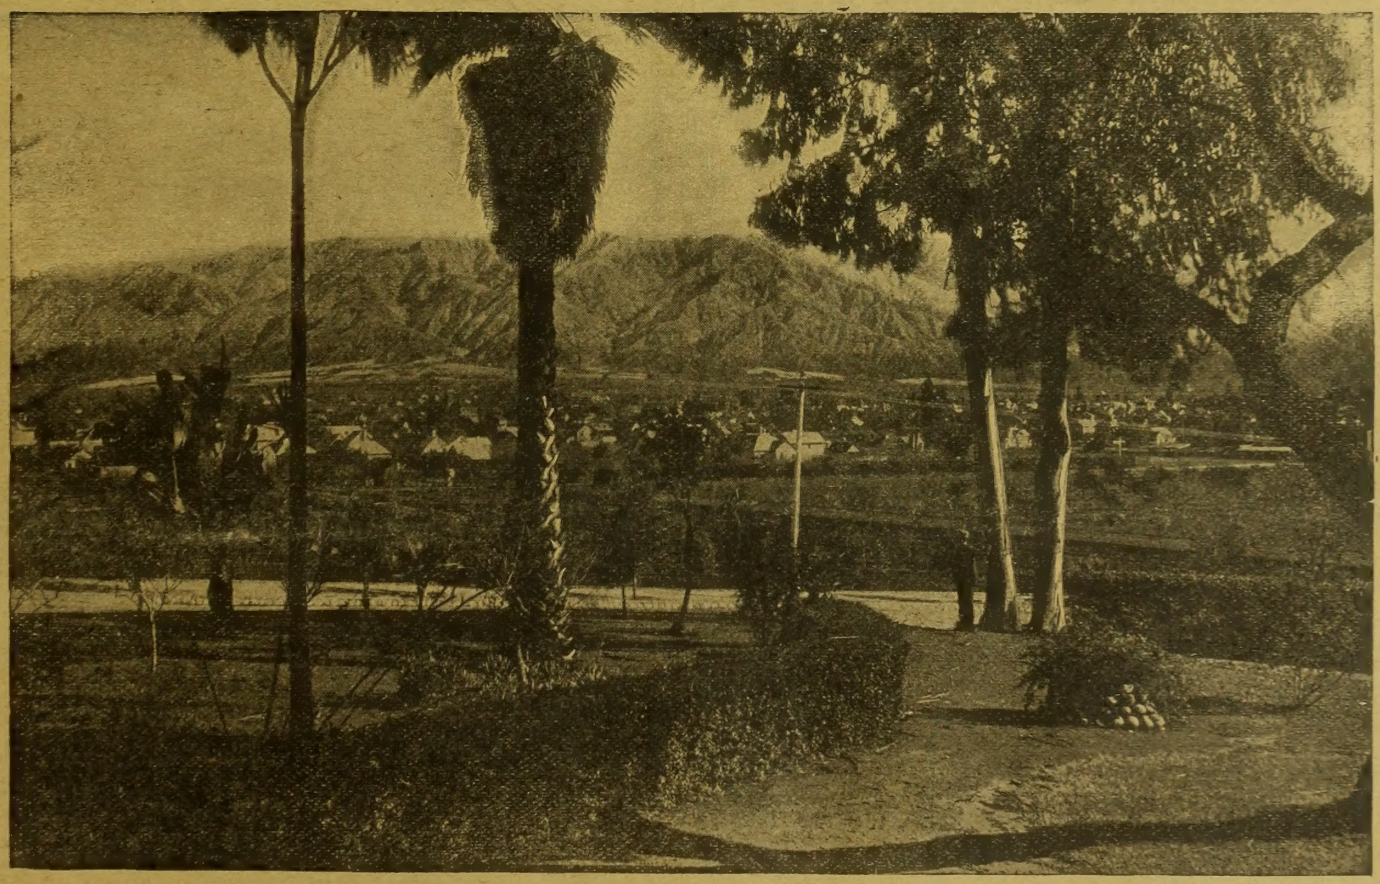
Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES | January 7, 1915 | SAN FRANCISCO

A California Mountain and Valley Vista

One of the Scenes Which Will Give an Invitation to Many an Eastern Visitor to Remain in Sunny California



The Opportunity that Comes but Once!

The homesite you wanted and hoped for is now within your reach

Situated at the foot of Mt. Wilson, at an elevation of 1500 ft., and commanding an unobstructed panoramic view of the beautiful valley below, with the ocean in the distance, this property is in a class of its own, for there are very few such spots to be found close to Los Angeles.

For the man who wants to make his home and grounds a show place, here is the chance. Nature has done her part—now it's up to you.

Five choice building sites to select from, each containing 7-10 of an acre, of which most of the land lies on top of a high and dry point known as Scenic Point; the balance of the land dips down into a canyon and gives wonderful opportunities for landscape work.

Building restrictions $5000. Water, gas, electricity, phone and car service. Within the city limits of Sierra Madre.

Jump in your machine and drive up to Sierra Madre—follow the auto signs marked "Scenic Point," and you will reach the Point via "good roads." See for yourself the wonderful view and opportunity that lies before you.

H. T. FENNELL, Owner

Scenic Point, SIERRA MADRE, CAL.

"If I were younger and wanted to exploit a great thing I would develop the J. H. HALE peach in California and make a specialty of it by name as a canned fruit of quality and there would be millions in it, rightly handled."

J. H. Hale

J. H. HALE — The Coming Peach for California Canning

Large Size — Round Shape — Rich, Yellow Flesh — Holds Shape and Doesn't "Rag Out"

To growers who realize that the largest profits lie in the highest quality fruit, the J. H. Hale offers a golden opportunity. It is a peach exceptional in size, and this means a peach that can be most economically handled both by the picker and the canner. It cans without stringiness, doesn't "rag out" and gives a clear, brilliant syrup. Its firm, solid flesh holds shape in the can. The color is a deep golden yellow, most attractive to the eye and the flavor is unsurpassed. Mr. Hale's nation-wide reputation gives you an added advantage. Think what a peach canned under his label means.

Superb Keeper and Shipper

Besides offering unusual features as a canning and drying peach, the J. H. HALE stands shipping and handling better than any known peach. Firm, solid flesh of cling, yet perfect freestone. Heavy, dense, meaty, yet without coarseness or stringiness. Luscious flavor. Colors up a week to 10 days before fully ripe, permitting extra early picking. Ripens about 5 days ahead of Elberta. The one peach for export shipment. Has paid Mr. Hale 33% more than finest Elbertas grown in same orchard.

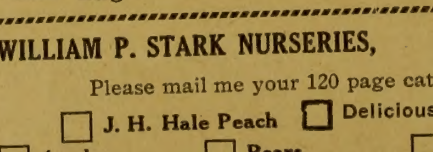
14,000 Trees Ordered By One Planter

The Redland Heights Ranch Co., with 1000 acres at Mentone, Cal., just above Redlands, are starting their initial peach planting with 14,000 J. H. HALE trees. They will skim the cream of the markets for years to come with this famous peach. Reserve your trees NOW. Our supply for this season's planting is limited. We furnish you trees budded direct from Mr. Hale's bearing orchards—the same which paid Mr. Hale $1420 per acre.

Refuse Fraudulent Trees!

The wonderful success of the J. H. Hale has brought a host of imitators. An obsolete variety, of no commercial value, known as "Hale's Early," is being substituted for the genuine J. H. Hale. Be on your guard. You can get genuine J. H. Hale peach trees, budded from Mr. Hale's own orchards, only from Wm. P. Stark Nurseries, Stark City, Mo.

This wooden tag, with Mr. Hale's personal signature attached to all genuine J. H. Hale trees, for your protection.



Genuine Delicious Apple

Most profitable apple you can grow. Brings $1 to $2 per box more than other varieties in all markets, regardless of prevailing apple prices for the season. A renowned success on the Pacific Coast. We furnish special 4 to 6 ft. one year trees direct from our nursery and at growers' prices.

132 Page Book FREE

Full of interesting facts, gives complete description of tree and fruit, most dependable, profitable varieties. Fully illustrated. No agents or solicitors. Our catalogue is our only representative. Buy direct and save 1-3 to 1-2. Book mailed free by return mail if you write today.

Thermometer Shelter for Orchard

Mr. J. W. Garthwaite Advances Ideas Which May Not be Accepted by All Citrus Growers. He Quotes Good Authority in Support of His Position. If Mr. Garthwaite's Contention is Correct Much Fuel May be Saved to Orchardists Now Trusting to Exposed Thermometers

BEFORE discussing the subject of the construction of a thermometer shelter for orchard use it may be well to consider the advisability or otherwise of using a shelter at all in frost protection work.

In general this matter of frost protection in the citrus districts is so new that many points in connection with it have not as yet received the thought that they will receive in years to come. One great difficulty in the way of work along this line is the time required to carry out any satisfactory experiments.

The usual practice in thermometer exposure has been, and still is, to hang the instruments in the open without shelter or protection of any sort, and at first glance this seems the only rational method.

Last winter the writer had a number of instruments exposed in this way, one of them being beside the "standard shelter" of the local station of the weather bureau. This thermometer always showed a night temperature of from one to several degrees lower than that in the shelter except when there was a heavy wind, when the readings were usually identical.

Little thought was given to this variation, it being considered merely natural that a sheltered thermometer would read high, until one night the unsheltered instrument dropped to 26 degrees, while the temperature in the shelter was little under 32 degrees. To be sure, there was some frost, but tomato plants within ten feet of the instruments were untouched by the cold.

We had been lighting our oil pots at 28 degrees to 30 degrees at some expense for fuel and labor, yet here was proof that a temperature of 26 degrees had not injured a much more sensitive plant than the orange or lemon tree.

The weather bureau's circular of instructions to cooperative observers was consulted and the statement found that "It will not do . . . to place the thermometer simply in the open air . . . it could not be depended upon to indicate the true air temperature either day or night."

Reference was then made to a text book on meteorology. Stripped of technical terms the views there expressed on the subject are that at night the reading of an unsheltered thermometer is lower than the true air temperature by from one degree to seven degrees. (See note.) The experience of the writer has been that the greatest difference occurs on still, cold nights; that is on nights when orchard heating would be most likely to be indulged in and might, therefore, lead to a considerable waste of fuel. On such a night, were it extremely cold, the instrument in the shelter would read somewhat high, but on any night that the citrus grower is called upon to consider this difference it is not of practical importance. The reason for the greater difference on still nights is that then the unsheltered glass bulb is cooled very much more rapidly by radiation than on a windy night, while such undue radiation does not take place in the shelter. However the suggestion was made that

THERMOMETER SHELTER

Showing Method of Making Shelter. The Shelf with Projection Is for Locating Pan with Water to Determine Freezing Point of Air.

perhaps we were approaching the question from the wrong side and that the reason for the similarity of readings on windy nights was that then cold air was driven into the shelter. To test this point a "sling thermometer" was brought into play. This, for the present purpose, is a thermometer mounted in such a way that it can be swung or whirled freely in the air. Thus a large quantity of air is brought into contact with the bulb and the amounts of heat lost and received by the thermometer are nearly equalized and the exchange of heat with the air is freely accomplished. (See note.) It was found that this instrument when whirled in the open gave, in any condition of weather, a reading corresponding to that of the instruments in the "standard shelter."

Another point to be considered, although unimportant if sheltering were otherwise considered inadvisable, is the protection offered the instruments from the elements. If spirit thermometers are used, and the only reliable "minimum registering" instruments are of this type, it will be found that the sun shining on the tube and rain or dew collecting on the bulb will cause the spirit to separate, making all readings faulty until shaken down. Another fault to which nearly all thermometers are subject is the erasure of the markings when they are wet. Both of these troubles are to a large extent obviated by the use of a shelter.

After consideration of these points and thorough discussion with growers and meteorologists the writer and several neighbors decided to shelter all their thermometers.

Then arose the question as to how this could best be done. The weather bureau shelter (see note) is a ponderous affair with double roof and closely lowered sides set five feet in the air on heavy uprights, and the construction of a number of these would have entailed too heavy an expense. The only need in this case was for a shelter that would prevent undue cooling of the bulb at night, would protect the instruments from the sun and rain and would permit perfect circulation of air. These qualities, combined with simplicity and cheapness of construction and portability, were secured in the stands shown in the cut. The boards of which the roof is made are ⅝ inches thick by 3¾ inches wide. They overlap each other enough and are placed at such an angle as to exclude direct sunlight and rain while they are separated by an inch in the clear to allow perfect ventilation. The floor is of the same material and as its purpose is to intercept radiation from the earth it should be wide enough to reach from edge to edge of the roof. The shelter is exposed with the long side of the roof to the southward while to facilitate reading the lower section of the other side which, since it faces away from the sun, is made shorter, is hinged. The extension of the floor was left to receive a pan of water if it was thought desirable to note the freezing point. The stand is of a height to carry the instruments about three feet above ground.

It has not been thought necessary to give exact measurements as thermometers are of different sizes and are mounted in various ways. If the main objects to be attained are kept in mind; namely, shelter from sun, rain and radiation; simplicity and cheapness of construction; and portability; a similar and equally effective shelter should be easy to build from this description and the appended photograph.

Note

The following are verbatim excerpts from paragraphs 64, 65 and 66 of "Meteorology," a text-book on the weather, the causes of its changes, and weather forecasting for the student and general reader. By Willis Isbister Milham, Ph. D., Field memorial professor of astronomy in Williams College:

"64. The Real Air Temperature—It is not easy to determine the temperature of a gas, because the thermometer does not indicate the temperature of the surrounding medium, but the temperature of its own bulb. If a thermometer is surrounded by an opaque fluid or solid, it takes up, by conduction, the temperature of the surrounding medium, and thus indicates the temperature of that medium. If the the bulb of a thermometer is exposed in a gas, however, its temperature is determined both by the conduction of heat to or from the surrounding medium and the difference between the radiant energy absorbed and emitted by the thermometer. A thermometer exposed in the open air gives neither during the day nor at night the real air temperature, even if it as an accurate, standard instrument. During the day it will indicate a temperature anywhere from 20 to 60 degrees above the real air temperature, because the excess of the insolation received over the radiant energy emitted is large. During the night the thermometer may indicate a temperature from one to seven degrees below the real air temperature, because it is radiating more heat to the sky and earth than it is receiving. A close approximation to the real air temperature can be determined in summer by exposing the thermometer in the shade of a small tree, and in winter by placing it on the inside of a north piazza post. The indications of the instrument in these positions will give approximately the real air temperature, although they may differ in certain cases by as much as three or four degrees."

In meteorological work the real air temperature is determined in one of three ways; namely, by means of a thermometer shelter, sling thermometer, or ventilated thermometer.

"65. Thermometer Shelter — The thermometer shelter as used by the United States weather bureau consists of a cubical box about three feet on a side, with a double sloping roof, closed bottom, and latticed sides. The purpose of a double roof is to shield the thermometers from the insolation of the sun. The outer portion of the roof absorbs the insolation, and the circulation of air between the two portions of the roof prevents the lower layer from becoming heated. The tight bottom ex-

4 Reasons WHY You Should This Year Plant Roeding's TREES

STRONG AND THRIFTY

Grown under ideal soil and climatic conditions. Properly planted, budded, pruned and packed for shipment.

TRUE TO NAME

Every tree sold under a guarantee that guarantees. Our careful methods of propagation insures against mistakes.

LOW PRICE

Considering the quality and intrinsic worth of our trees, the prices we are asking are exceptionally low. Prove this by investigation.

BACKED BY EXPERIENCE

More than 30 years of experience are back of every tree we sell. This means a great deal to every planter, for the success of your orchard depends upon the quality of trees you set out. Our experience and large facilities enable us to grow the best trees and to keep abreast of the times.

In addition to the above four reasons for purchasing Roeding's True Trees, there is still another—

Free Advisory Service

—this service is absolutely free to every purchaser of our trees. It means absolute protection against costly mistakes—advice and help in cultivation, pruning, spraying, packing, marketing, etc., to enable you to grow and reap the profits of extra fancy fruit. We not only advise with you about what varieties are best adapted to your particular soil and locality, but we take a particular interest in your orchard to aid you in securing profitable results. It is the premium fruit that brings the price and Roeding's trees produce premium fruit—if properly grown and cared for. Write us today for further information about our Free Advisory Service.

CITRUS Trees

Our stock comprises all the leading varieties of

ORANGES
LEMONS
POMELOS

Avocados, Limes, Etc.

Our stock is guaranteed true to name and is grown under ideal soil and climatic conditions.

DECIDUOUS FRUIT TREES

We also carry a complete stock of apples, pears, plums, peaches, prunes, grapes, etc., as well as ornamental and evergreen trees of every kind and description.

WRITE FOR CATALOG AND PRICES

Our handsomely illustrated 1915 price catalog is just off the press. We wish to send a copy to every one who is thinking of planting anything in deciduous, citrus or ornamental trees this season. It will cost you nothing but a postcard. Send today.

Citrus and Tropical Fruits

BUD SPORTS IN AGRICULTURE

By C. S. Pomeroy Before Forty-Fifth State Fruit Grower's Convention at Los Angeles

BUD sports, bud mutations or bud varieties are terms which are applied to the variations found in plants that are propagated vegetatively. These variations may consist of differences in color or character of the bloom, of changes in shape, size, color, ripening period, quantity or quality of fruits, or variegated, curly or cut-leaf forms, of weeping or upright habit of growth, color of branches, the elimination or addition of thorns, increased or decreased vigor of growth, or of modification of any of the other numerous characters of plant growth. The sport may appear as a variation affecting the entire plant, or a large or small part of it.

One of the best known examples of a bud sport is the nectarine, which is a smooth or fuzzless skinned peach. This originated as a single branch in a peach tree, and duplicates of this sport are continually being found in various parts of the country. Similarly, peach sports are frequently seen in nectarine trees.

All plant growers recognize seed variations and realize that no two seedlings are exactly alike. Just as truly as every seedling may be regarded as a seed variety, so is every branch a bud variety. Let me repeat what has been said regarding this subject by Dr. L. H. Bailey, one of the foremost horticultural authorities of the present day.

"I am now ready to say that I believe bud variation to be one of the most significant and important phenomena of vegetable life, and that it is due to the same causes, operating in essentially the same way, which underlie all variation in the plant world. The chief trouble in the consideration of this subject has been that most persons have observed and recorded only the most marked or striking variations, or those which appear somewhat suddenly (although suddenness of appearance usually means that the observer had not noticed it before) and that they had, therefore, thought bud variation to be rare and exceptional. The truth is that every branch or phyton is a bud variety, differing in greater or lesser degree from all other phytons on the same plant."

Any one who will give a few moments' careful thought to this problem will readily realize that there can be no doubt but that bud sports are of much more frequent occurrence than is commonly supposed. After a new form is once established the only means of determining whether it was of seed origin or a bud mutation is by reference to the records of its history, and in most cases there is no authentic data of this sort available. From the earliest period at which any interest has been shown in plant varieties, it has been customary for agriculturists or horticulturists to explain every new variety which has appeared as being of seedling origin. The well-known variations in any group of seedlings of the cultivated fruits, and of many other perennial plants, have been kept in mind and have been thought to form a sufficient basis to acount for all new forms which have occurred in the plant kingdom. Even today, when a new apple is discovered, or a new peach found, it is instinctively described by the grower as a seedling; indeed there has usually been no thought of any other possible explanation, and so no effort has been made to demonstrate the correctness of this explanation of its origin, but it has been considered to be a self-evident fact.

There are many well authenticated and unquestioned instances of the occurrences of bud sports which are admitted as genuine, even by the opponents of the mutation theory, but if there was only one such established case, that would be sufficient to discredit the practice of blindly adopting the seedling explanation to account for all new forms. Since bud sports have occurred, there is no reason why they shall not occur continually, just as frequently, perhaps, as seed variations do, and with this possibility established, it becomes just as necessary to have absolute proof of the seed origin of a plant before it can be classed as a seedling as it is to have undeniable evidence of its bud origin before it can be rightly listed as a bud sport or mutation. For this reason the present accepted explanations of the seedling origin of many of our fruits and other varieties are open to grave question and doubt in the minds of those who have studied this subject carefully.

The time at my disposal will not permit me to dwell longer upon the theoretical side of this question, and, indeed, we have so many examples of bud sports of unquestionable origin that further theoretical proof of their occurrence in unnecessary.

As early as 1865, Carriere gave a descriptive list of 154 named varieties of plants of commercial importance in France which had originated as bud sports. Many of the best-known roses, carnations, chrysanthemums, violets, and other garden plants originated in this manner, and critical gardeners are always on the watch for such variations. Dr. Bailey asserted in 1906 that there were probably no less than 300 named horticultural varieties of bud origin which were being grown in this country at that time.

A plant which might be considered to have an ever-sporting habit is the common Boston fern (Nephrolepis Bostoniensis), so widely grown as a house plant. So numerous and so marked are the variations on this species that on many plants it is almost impossible to find any two fronds exactly alike, or even two similar pinnae on a frond. Taking advantage of this sporting habit, the F. R. Pierson Company, of Tarrytown, New York, has selected and propagated some of the most marked and desirable variations, until they now have isolated and established by vegetative

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas

U. S. A.

Teague trees are started right, grown right, and shipped right.

propagation at least ten forms distinct from the original Boston type.

Another plant on which the variations are very noticeable is the old-fashioned Marguerite, which is so popular in the flower gardens. Especially marked are the variations in the number of ray florets in the flower heads and in the incisions of the leaves. Wide variations and many intermediate forms will be found on many plants and even on single branches of an individual plant.

A striking example of a bud sport was noticed a few years ago at the plant introduction garden of the United States department of agriculture, at Chico. Cuttings of a spineless cactus were received there in 1905 and grown for two and a half years. They were then cut into individual joints and reestablished in nursery form. One joint was noticed to have three or four spines in one or two puvini on one side, but no attention was paid to it, and it was lost sight of in the planting. The following spring, 1909, all these plants were cut back to the original cuttings for stock, and it was noted that a part of one plant was very spiny and the rest of it was as spineless as the other plants. In the spring of 1910 the new growth on this plant was again in part spiny, and it was again cut back. In the spring of 1911 it was found that all new growth on one side of the plant was practically spineless, while the other side was exceedingly spiny. Several of both spiny and spineless joints were planted that season and all came true to the individual cuttings planted. This case is described and illustrated in Bulletin 31, new series, of the United States department of agriculture.

In an old apple tree of the Porter variety, at Scotland, Connecticut, a large limb was noticed last year bearing seedless fruits which were also quite different in size, shape, color and quality from the rest of the fruits on the tree. This limb bore similar seedless fruits again this season. Seedless grapes, which originated as bud sports, have also been reported.

The larger part of our investigations regarding bud sports has been conducted with citrus fruits, and a great number of very marked variations have been found. These consist of differences in size, shape, texture, color, quality, and seediness of the fruit, time of ripening and size of the crop, shape and size of the leaves, size of the trees and habits of their growth. In the Marsh seedless grapefruit, besides several other types, we have a very seedy form which is found as entire trees or as a few fruits in a standard type tree. Seedless fruits are also found in trees of the seedy type. In the Washington Navel orange variety we have 11 distinct types which are found as bud mutations and are of very frequent occurrence. They have been noted in all degrees of frequency on the trees. Only one fruit of a sporting type may be found on a tree, or several fruits of the type may occur on a single branch or scattered over the tree. One specimen of several forms may be borne on different parts of the tree, or different branches may be found, each bearing a different type of sport. The entire tree may be a single mutation form, or its two sides may be different types, and numerous other combinations of two or more of the 11 variations are found. In some

TREES

WE are digging our citrus stock now and the trees are splendid. We never handled or grew finer trees. They are of large caliper, well branched and absolutely free of all insect or fungus pests. We have about 75,000 trees to dispose of during the coming season which accounts for the low prices at which we are offering them: Oranges, Navel and Valencias; Lemons, Eureka; Grape Fruit; Limes. These are not "cheap" trees. They are first class in every particular but we are overstocked. The trees can be seen any time at our Nursery Salesyard back of the big store.

We also carry a full line of ornamentals, parking and street trees, roses and fruit trees. We invite your inspection.

FT. SCOTT & NEVADA LIGHT, HEAT, WATER & POWER CO.

Nevada, Mo., Nov. 25, 1914.

Gentlemen:

In response to your inquiry as to the satisfaction the No. 28 Pomona Pump is giving us, we are pleased to state to you that we consider ourselves very fortunate in having discovered this pump. As you will remember, we tried out other makes of double-acting plunger pumps before purchasing the POMONA, and were compelled to abandon them on account of the severe service required by us and their inability to perform this service. Your recommendation for this pump has not only been fulfilled, but has been exceeded.

The last plan of lifting water we used before installing the POMONA Pumps was an air lift system, and we used a 150 H.-P. boiler for lifting the same amount of water that the POMONA Pump lifts with between 8 and 9 H.-P. applied to the pump. The saving has been almost equal to the price of the pump in the five months that it has been installed, and the pump has not cost one moment's inconvenience, and it has been less trouble to take care of than it was to take care of the air compressor alone on the air lift system.

We will take great pleasure in entering further into detail upon this matter with any prospective purchaser of your pump, because we are convinced that you have solved the problem of pumping from deep wells.

Yours very truly,

(Signed) J. H. DUNKEL, General Manager.

TABLE GRAPES

Written for California Cultivator
By Leonard Coates

A TABLE GRAPE is not necessarily a shipping grape, nor is a shipping grape always a table grape. The former is of superior quality, while the latter, whatever its eating quality, must possess endurance, or carrying ability. Amongst what are generally classed as "table and shipping grapes" are Flame Tokay, Malaga, Emperor and Black Morocco, none of which are of fine quality, but all are of firm texture and large size, and therefore among the best to ship to distant markets.

A succession in ripening of good eating or table grapes, and which would, of course, do for local markets if properly handled, might be somewhat as follows: Chasselas de Fontainbleau or Sweetwater, Red Chasselas, Black Malvoise, Feher Zagos, Golden Queen, Muscat Frontignan, Black Hamburg, Thompson Seedless, Sultanina-rosea or Red Seedless, Rose of Peru, Lady Finger, White Cornichon, Pierce, Muscat, Mrs. Pierce, Black Cornichon, Mission.

Most table grapes do better on heavy land than in light soil, which means, usually, that grapes of this class are stronger growers and require longer pruning, and that size of berry is more to be desired than in varieties grown for wine making. For a profitable table market grape on very heavy or adobe soil, perhaps the Black Cornichon would be the most profitable. The Muscat of Alexandria will also flourish in very heavy soil. The only grape mentioned in this list of native American origin is the Pierce, formerly known as Isabella Regia, which thrives in very moist, heavy soils. This would apply to all the American grapes grown in California, such as Concord, Isabella, Delaware, Agawam, etc., which do not stand well in semi-arid conditions where many vinifera varieties would succeed.

The public in California know practically nothing of the finer eating grapes, especially of the many Muscat crosses and hybrids. To get such grapes to market—even nearby markets—it would be needful to use much more care in handling and packing, which means more expense to the grower, who must obtain a better return, or the public will have to continue to eat Tokays and Malagas—half ripe at that. In this connection it is well to lament the fact that we have not more intelligent and progressive local fruit dealers, who could assist very much in building up a demand for a better quality of better packed California fruits.

WINTER IRRIGATION

It is well for the orchardist to store up some of the waters which may be going to waste. We may add that many orchardists of the state for many years have saved this waste. Usually during the months of January and February, if streams are not banked full, a large amount of water runs off to the ocean. This, flooded over orchard lands and allowed to remain for hours or days, followed by thorough spring cultivation, will save summer irrigation at a time when labor is needed in other directions. It is very probable that some lands may be injured by too heavy flooding. We note in the Huntington Beach News an item regarding Mr. J. J. Booth's plan with apple trees:

"Mr. Booth thought he would give his trees the 'water cure,' and he turned on the flow from his artesian well for about two months during the winter season, giving the ground all the water it would absorb. His idea was to supply the ground with enough moisture to unite with the lower stratum of water which underlies the entire country in this vicinity—the theory being that when once this bond has been effected the water from the lower level will be attracted toward the surface by the rays of the sun. The experiment has worked wonders with the old neglected orchards, as from these same trees Mr. Booth has picked some of the finest fruit in the vicinity and has gathered a second crop from some trees of the Early June variety, and the crop on many of each of the varieties has been so abundant that it was necessary to use props to save the trees."

THE APPLE WOOLLY APHIS

The University of Arizona Agricultural Experiment Station, answering complaints concerning the woolly apple aphis and control of this pest through entomologist Dr. A. W. Morrill, gives the following advice:

The woolly aphis is attacked by several natural enemies known as "lady bugs," "aphis lions," etc. These natural enemies usually clean up the top of heavily infested trees during the summer months. Notwithstanding the assistance of these friendly insects, the woolly aphis is frequently sufficiently injurious to the branches of infested trees to justify spraying

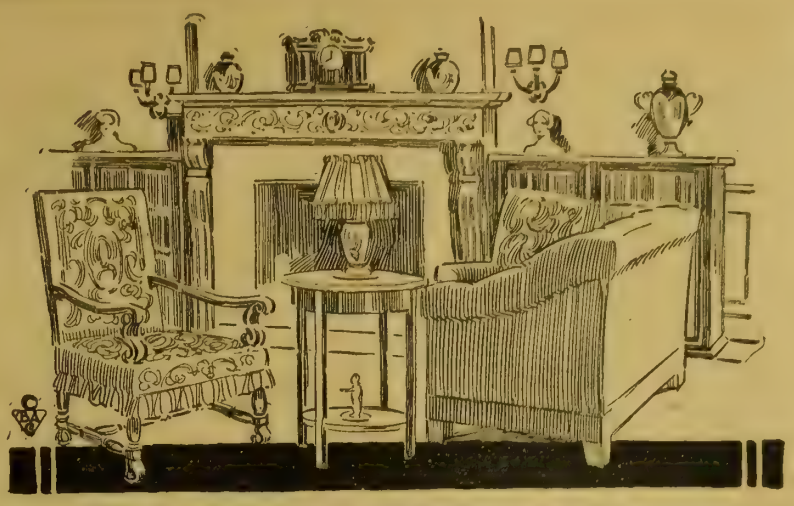
he trunks and branches of the trees ay be sprayed at any time of the ear when the woolly aphis is multiying injuriously. The best insecticide for this purpose consists of a ombination of soap with a nicotine xtract. Concerning this combination isecticide the following paragraph is noted from a recent publication of he Arizona Agricultural Experiment tation:

"Black Leaf 40," "Nikoteen," and To-bac-ine" are trade names for hree of the best known concentrated obacco extracts. The first named is sed in Arizona as a sheep dip and is onsequently more easily obtained han other brands. It is guaranteed to ontain 40 per cent nicotine and is reailed in gallon cans at $12.50 and in alf-pint tins at 85 cents. While Black Leaf 40" is especially mentioned herein, other brands of concenrated nicotine of equal strength may e substituted in the recommendations hich follow. A teaspoon of this conentrated nicotine compound is sufficient for one gallon of spray. Soap hould be used with the "Black Leaf 0" at the rate of one-half ounce in ne gallon of the spray. This is not rimarily for the insecticidal value of he soap, but for the purpose of giving he spray better penetrating and ticking properties. Whale oil soap, ard laundry soap or one of the soap owders may be used in the foregoing pray mixture. The first is the more ffective, but has the disadvantage of n unpleasant odor. The soap should e dissolved in a small quantity of hot water, after which sufficient water s added to make one gallon. Add to his the tablespoon of "Black Leaf 0." This insecticide is not always mmediate in its effects, but the thoroughness of the work can be judged 24 hours after the application is made.

The proper means of application of he spray is no less important than he composition of the spray itself. Generally speaking, satisfactory results in combating the woolly aphis on the trunk and branches of the trees can not be expected if cheap hand sprayers or old, worn-out barrel pumps are used, although it is possible to treat a few trees with a small garden sprayer by using care, time and material beyond the point of practicability for a large number of trees. If possible, the spray should be applied with a pressure of betweeen 125 and 200 pounds.

For the root infesting form of the woolly aphis, it is recommended that the earth be removed to a depth sufficient to lay bare the main lateral roots for a distance of three or four feet from the crown of the tree. This work can be accomplished with the aid of a shovel or hoe, until the upper roots are reached, when gloved hands and a stick to loosen the earth can better be used to enable its removal without injury to the roots. After the roots are laid bare in this manner, they should be thoroughly sprayed with the whale oil soap and "Black Leaf 40" combination advised above for the tops of trees, using from five to ten gallons, according to the size of the tree. A right-angle nozzle or an elbow joint should be used in order to allow the spray to be applied to all parts of the roots. The idea should be to thoroughly soak them, and it should be borne in mind that it is preferable to use an excess than too little of the spray. High pressure is preferable to low pressure, as in the case of applying spray to the tops of the trees. After the treatment of the roots, the soil should, of course, be replaced. It would be an advantage to hill up the earth to a depth of three or four inches all around the crown of the tree, and after each rain or irrigation to loosen up or mulch the earth around the crown by means of a rake or hoe. If the soil has a tendency to bake and crack its mechanical condition may be improved by mixing in more or less sand.



Don't Fail to Take Advantage of

Barker Bros. 35th January Clearance!

More than Half-a-Million Dollars'

Worth of Beautiful, Distinctive, Dependable and Notably Superior

Furniture and Home-Furnishings

(Including $50,000 worth of Grand, Upright and Player Pianos)

At Genuine Reductions of

LENTIL PRODUCTION IN CALIFORNIA

Written for the California Cultivator By Svetozar Igali, Editor California Hungarian Farmer.

THE following article is written by Mr. Igali from practical knowledge of lentil culture, As he says, this vegetable is not grown in this state to any extent. We wished further information regarding the possibilities of its culture and are glad to offer this from the pen of a practical grower. Mr. Igali is editor of the "California Magyar Farmer," or "California Hungarian Farmer," the only Hungarian-American paper published in this country which treats of farmers and farming interests. Mr. Igali writes that the European war has had serious results for his people, not only in Europe but in California, and it is affecting their prosperity and his.—Ed.

* * *

It is difficult to understand, but it is a fact that the cultivation of the lentil (Lens esculenta) is carried on to a very limited extent in California. Study the year book of the department of agriculture and convince yourself that the culture of this nutritive and toothsome vegetable is neglected not only in California but all over the United States as well. Prof. Bailey in his "Cyclopedia of American Agriculture" acknowledges its nutritive value, but at the same time contents himself with but a scant description of it.

I tried the cultivation of lentils on my 40-acre mountain ranch near Santa Cruz this year, the soil being mostly a loose, decomposed granite, and obtained fair success. Beans grown in the vicinity sold for three and a half cents per pound, but I had no difficulty in disposing of my lentils at ten cents per pound, while the expense of raising the two crops is practically the same. Beans will produce 1200 to 1400 pounds per acre while lentils may run as high as 17 bushels or 1000 pounds per acre. Of course the price is higher and will be next year especially when the German and French imports will surely be stopped or greatly reduced. This being so, would it not be wise for farmers tc take up the cultivation of this crop on a larger scale?

The lentil is more digestible than the pea, containing 24 per cent albumen and 54 per cent starch and dextrin. An ancient Hungarian adage affirms that those who eat it will be wise and handsome. Today in Hungary the lentil is used not only as a food but its flour is used in many cases for poultices.

Considering the large amount of loose, chalky or dry sandy terrains in California I would suggest more extensive planting of lentils. Compact adobe land is not so well adapted to the culture of this crop. In France they grow the commune lentil, or L. de Lorraine; in Austria they have the big seeded or the Stockerau variety, and in Hungary the variety called Gomor. This latter is a smaller kind. In rotation they are planted after Egyptian corn or sugar beets, following with some grain—wheat or barley.

In California I planted lentils t first of March but think better sults would be obtained by planti as soon as the rainy season is ov especially in sections where there no danger of frost, as the young plan will not stand frost. In sections whe late spring frosts occur planti should be postponed until April.

The culture consists of deep plo ing in the fall in order that the s may retain winter moisture, follow by a shallow one in the spring, th harrowing. The seed is sown in dri two feet apart, or broadcasted, but should always be mixed with o fourth its bulk of barley seed, becau if sown alone the stems break do and lie on the ground, spoiling it the harvest. In drilling the seed used one and a half bushels to t acre—one and a half bushels of l tils, mixed with one-half bushel barley. More than this should used if broadcasted, using always same proportion. After sowing raked or harrowed so that the se was covered to the depth of an in As the row became visible I kept weeds down and the ground loose hoeing once or twice.

It is important to harvest at proper time. Do not wait until pods are all dry, because the seed liable to fall out. The best time harvest is when the stems begin show a yellowish tint even though pods are yet green. The plants pulled, gathered in small sheaves bound with straw strings. Let th dry on the ground for three or f days, then beat the seeds out wit flail, after which they are put throu a winnowing machine. The aver output per acre from lentils is fr 15 to 20 bushels. To avoid dam by the lentil moth (Bruchus lent it is advisable to dispose of the h vested crop as promptly as possi

The straw remaining after thre ing affords an excellent fodder for tle. An acre will furnish abou ton and a half.

The best lentils in the Europ market are produced as mentioned fore, on the volcanic soils or s similar to our decomposel gran At Gaillardon, near Rambouil France; at Stockerau in Austria at Gomor in Hungary, the best le producing country of the world, soil is all the same, a loose dry, sa or chalky volcanic decomposition.

A Tip on Almonds

On this continent Almond are grown only in California The American market alon demands *four times* the pres ent supply.

With practically an unlimited home market and a monopoly of the product

Plant Almond Trees if you are seek ing a real money-making investmen We have an extra fine lot of tree growing on Bitter Almonds, Peach and Myrobolan Root, but as there usually a shortage of trees on Bitte Almond, place your contract in mediately—don't delay.

P. O. Box Newcastle, Ca

ave hundreds of acres of such land n California which are today lying dle.

As the lentil takes from the soil bout four per cent of nitrogen and ome potash, the best fertilizer is vood ashes and some nitrates of am- nonia salt, but beware of rich de- omposed stable manure which devel- ops stems and foliage at the expense f the grain.

After the plants are bound into heaves to dry they must be protected rom birds, especially doves and wild igeons, as they are so fond of the rains that they will gather from far nd near.

In the Santa Cruz mountains where he rainfall is 15 to 18 inches I did ot irrigate. I think it possible to aise a good crop where the precipita- ion is ten inches or more but doubt ot irrigation would increase the ield. In Hungary we have in some ears the same dry springs which we ave here in California and in these ases if the peasants did not apply he lessons which they learned from heir ancestors the crop would be lestroyed. After harrowing the field hey spread over it a mulch of fresh trawy stable manure. This cover- ng protects the young plants from he scorching rays of the sun and the rying northeast spring winds and eeps the moisture in the soil. If he California farmer pursued the ame method without doubt he could ecure a fair yield with little irriga- ion, even in interior valleys. Would especially recommend that plowing be t least 12 inches deep. One thing which is fatal to the lentil crop is wet ground. If at all prolonged it is sure o prove disastrous.

In addition to the direct profit from he crop the straw is quickly cleaned up by live stock. It is especially valu- able for dairy animals. I have offered cows vetch hay and lentil straw in separate bunches and they will in- variably leave the hay and go to the lentil straw.

As to pests, of course the aphis is destructive, as it is with many other similar crops, and I have found that the ground squirrel is desperately fond of the lentil.

WHITEWASH

Whitewash is the cheapest of all paints, and for certain purposes it is the best. Lime, which is the basis of whitewash, makes a very sanitary coating and is probably to be pre- ferred for cellars and the interior of stables and other outbuildings. (The following directions for making white- wash are taken from "White Paints and Painting Materials," by W. G. Scott:)

Ordinary whitewash: This is made by slaking about 10 pounds of quick- lime with 2 gallons of water.

The lime is placed in a pail and the water poured over it, after which the pail is covered with an old piece of carpet or cloth and allowed to stand for about an hour. With an insuffi- cient amount of water the lime is "scorched" and not all converted into hydrate; on the other hand too much water retards the slaking by lowering the heat.

"Scorched" lime is generally lumpy and transparent, hence the use of the proper amount of water for slacking and an after addition of water to bring it to a brush consistency.

Factory whitewash (interiors): For walls, ceilings, posts, etc.

(1) 62 pounds (1 bushel) quicklime, slake with 15 gallons water. Keep barrel covered until steam ceases to rise. Stir occasionally to prevent scorching.

(2) Two and one-half pounds rye flour, beat up in half gallon of cold water, then add two gallons of boil- ing water.

(3) Two and one-half pounds com- mon rock salt, dissolve in 2½ gallons of hot water.

Mix (2) and (3), then pour into (1) and stir until all is well mixed.

This is the whitewash used in the large implement factories and recom- mended by the insurance companies. The above formula gives a product of perfect brush consistency.

Weatherproof whitewash (exteri- ors): For buildings, fences, etc.

(1) Sixty-two pounds (1 bushel) quicklime, slake with 12 gallons of hot water.

(2) Two pounds common table salt, 1 pound sulphate of zinc, dissolved in 2 gallons of boiling water.

(3) Two gallons skimmed milk.

Pour (2) into (1), then add the milk (3) and mix thoroughly.

Lighthouse whitewash: (1) Sixty- two pounds (1 bushel) quicklime, slake with 12 gallons of hot water.

(2) Twelve pounds rock salt, dis- solve in 6 gallons of boiling water.

(3) Six pounds Portland cement.

Pour (2) into (1) and then add (3).

Note.—Alum added to a lime white- wash prevents it rubbing of. An ounce to the gallon is sufficient.

Flour paste answers the same pur- pose, but needs zinc sulphate as a preservative.

Molasses renders the lime more sol- uble and causes it to penetrate the wood or plaster surface; a pint of molasses to 5 gallons of whitewash is sufficient.

Silicate of soda solution (about 35 degrees Baume) in the proportion of 1 to 10 of whitewash produces a fire- proof cement.

A pound of cheap bar soap dissolved in a gallon of boiling water and added to about 5 gallons of thick whitewash will give it a gloss like oil paint.

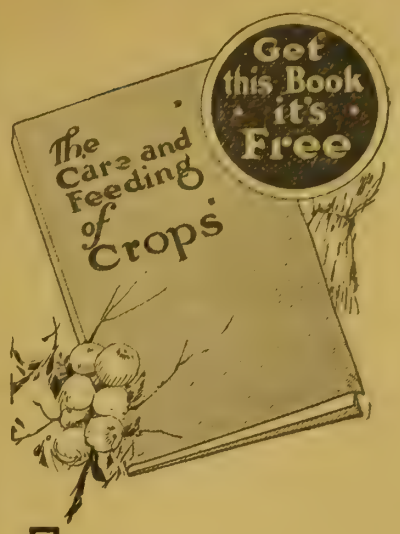
An old recipe for whitewash, is- sued by the lighthouse board of the treasury department, said to be very good for outdoor exposure is as fol- lows:

Slake half a bushel of unslaked lime with boiling water, keeping it cov- ered during the process. Strain it and add a peck of salt, dissolved in warm water; three pounds of ground rice put in boiling water and boiled to a thin paste; half a pound of pow- dered Spanish whiting and a pound of clear glue, dissolved in warm wa- ter; mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace; and when used, put it on as hot as possible, with painters' or whitewash brushes.

The washes which contain milk, flour, or glue are not to be advised for use in damp, interior places, ow- ing to danger of decomposition of the organic matter. For such loca- tions it is better to use one of the formulae containing none of these in- gredients. Whitewash is applied with a broad whitewash brush and is spread lightly over the surface, no attempt being made to brush it in as is the case with an oil paint.

"I saw your advertisement in the California Cultivator and would be glad to know more about the article mentioned." That's good business form, surely.

"Bion, seeing a man who was tear- ing the hair off his head, said: 'Does this man, then, think baldness a rem- edy for grief?'"



Barnyard Manure Can- not Take the Place of a Commercial Fertilizer

When crops are taken from the soil season after season there is a loss of plant food which cannot be supplied by manure.

Any crop requires a par- ticular kind or combination of kinds of plant foods before it will grow to its full matur- ity. Farm manure increases the condition of the soil but does not supply these food elements.

Read this Book

It gives you just such sim- ple, vital facts which are so necessary to you in order to grow the largest crop on your land. Without this informa- tion you are working in the dark—you cannot get the greatest good or the largest crop without working intelli- gently and supplying the land with the necessary food ele- ments.

Don't put off sending for this book, but write for it to- day. Ask any questions about fertilization which puzzle you and you will receive a clear, definite answer from our ex- perts. They're here to serve you, without any expense to you.

Write for this book today —don't put it off because you might forget.

GREAT CROPS OF
STRAWBERRIES
And How to Grow Them

IS the most beautifully illustrated and most complete strawberry book ever written. It teaches the Kellogg Way of doing things and tells the whole strawberry story from start to finish. It explains how the famous Kellogg Pedigree plants are grown on the great Kellogg plant farms in Idaho, Oregon and Michigan, and pictures and describes all the best varieties, including the ever-bearing kind.

OUR FAMILY STRAWBERRY GARDEN

Whether you have a small garden or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries the year round for less than one cent per gallon. Our Book gives full information.

STRAWBERRIES
Yield more dollars per acre and give quicker returns than any other crop. Get our 64-page book and learn THE KELLOGG WAY, and make $500 to $1200 per acre. The Book is FREE.

The Lawn and Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator

ALL California is busy putting on its best dress for the visitors and everybody says the visitors are coming.

Give the lawn a good application of well-rotted manure. We say well-rotted because if it is not Bermuda and innumerable other seeds may be introduced. If well-rotted manure is not available use a complete lawn fertilizer, or any good complete fertilizer will prove beneficial. Buy a good high grade fertilizer for it is not economical to pay freight on "fillers" or low grade stuff. Where Bermuda has invaded the lawn the cool weather of early December gives it a burnt appearance. This may be helped by the application of commercial fertilizer and wetting down slightly. This, with the warm days which we are now given, will soon bring back the green. Where Bermuda has not taken almost entire possession of the lawn this is a good season to rake out and discourage its more general growth. It is also a good time to seed in the bare spots. Make liberal application of seed, almost as much as for a new lawn, sprinkle lightly with manure, sawdust or other mulch, and then keep wet. Bermuda grows but slightly at this time of the year while blue grass will do well. It is presumed the leaves have all been raked off and added to the compost heap.

Use the hotbed or the glasshouse to start the less hardy annuals for replanting next month. If a glasshouse is available be sure that all dead and dried leaves or dirt of any kind are kept cleaned off. They are breeders of fungous and other pests. This is said to be the coldest month of the year when averages of the weather bureau are considered but it is really the beginning of our spring and every step should be taken to secure a start for a big showing of early spring flowers.

Of course this is pruning month for roses, wistarias, poinsettias, lemon verbena, in fact, all deciduous shrubs. The poinsettia prunings may be used for cuttings for new plants where they are desired. Make the cuttings long enough to take in three or four "eyes" and bury two-thirds of their length in sand or sandy soil. Gather prunings and burn. They are unsightly and of little value in the compost heap. Deep spading around all shrubs and in all beds which are to be used for spring planting should proceed this month. It is hardly possible to give too heavy a dressing of stable manure where sufficient water is available for spring irrigation.

Presumably a good supply of our native poppies have been sown in all waste corners and along paths. If this has not been done invest two-bits in a packet of them and at least plant a few. If every resident of California would make it a religious principle to sow a few of the native poppies every year, even if but a nickel's worth, it would add wonderfully to the attractiveness of the state.

Other annuals such as sweet peas, where they were not planted earlier, phlox, stocks, centaureas, scabiosa, coreopsis, mignonette, candytuft and those of the more hardy type, may be planted.

This is the beginning of the bulb planting season. We mean, of course, the spring bulbs. Gladiolus may be put in the ground. All the little corms which have formed around the old bulbs should be in the soil before this. However, to secure extension of the season the large, full-sized bulbs may be planted as late as June, but no month between now and then should miss a planting of this wonderful flower. New varieties of iris, or those which have not been divided, may be planted but they should be in the ground at once for new root growth is now starting which will give splendid bloom a few weeks later.

It is possibly a little early to divide caladiums, cannas, and other small bulbous plants but the last of the month and the first of February will be timely for that work.

CURING, STORAGE AND FORCING OF GLADIOLUS CORMS

By Madison Cooper in The Modern Gladiolus Grower

It was suggested by Mr. G. D. Black last month that gladiolus bulbs will lose much of their vitality if stored in a warm pace. We beg to suggest in this connection that altogether too much stress is laid on the necessity for drying or curing bulbs before storing. The more drying and curing there is done, the greater the loss of vitality, and only enough drying should be practiced to free the bulb of surplus moisture contained in the skin or husk, so there will be no tendency to mold. After that the bulbs can be stored in thin layers safely in a reasonably dry air at a temperature of 32° F. to 40° F. for almost an indefinite period.

It is not our idea to suggest that no drying be done, but to caution against overdoing the matter. A comparatively slight drying is all that is really necessary, especially if this is done in full sunshine and a full circulation of air. Sunshine tends to not only dry out the husk quickly, but it is a great purifier and germicide and kills mold spores and certain forms of fungus growth. The sun also tends to eliminate various scab diseases and rots, and is a valuable help in preventing troubles of this kind.

The storage of gladiolus corms has not been given the care and attention in the past that it should have had, and very little is known on the subject except as the practical details have been worked out by each individual for himself. It is suggested that storage under refrigeration is the right place for gladiolus bulbs, and if they are so stored we believe that they may be carried, as before suggested, at the temperatures stated for almost an indefinite period and practically without deterioration. It would seem that bulbs might be held over after digging in the fall, until the next fall, for forcing during the winter. This is only by way of suggestion, but someone will doubtless make the experiment. It is well known that plant life which is retarded in this way by cold storage at uniform temperatures, and held past its natural season of growth may be forced much more quickly; lily of the valley pips especially are a good illustration, and there seems no good reason why the same principle will not apply to the forcing of the gladiolus. If this method is properly worked out, we may expect, within the next few years to see many different varieties used for forcing, and the gladiolus will thus become an all the year round flower.

Plant Pears for profit. California Bartlett ripen earlier than Eastern and Northwestern grown pears. During their season they monopolize the markets of the United States and Canada.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator

THE first month of the year may be considered the spring planting month for many sections of California. With potatoes, planting would not be safe except in very protected sections where the soil is warm and dry. The first of February will see heavy planting of early potatoes in warmer sections.

The month of January, however, is none too early for general preparation for the early spring garden. Heavy applications of manure well spaded or plowed under this month will result in far better condition of soil in the summer when moisture may not be so plentiful as we would desire. Decaying vegetable matter is a wonderful moisture holder. After spreading or plowing keep surface stirred often enough to prevent any growth of weeds; how soon after the rains will depend on the soil. Sandy loams may be cultivated almost immediately while the heavier clays call for particular attention.

One feature of the garden for January not used in California to the extent it should be is the hotbed. This is a good month for starting plants for February planting. Instructions for making the hotbed have been given in former issues of the Cultivator.

Potatoes, cabbage, carrots, turnips, peas, lettuce, onions, radishes, cauliflower, celery and other hardy plants may all go into the open garden. Tomatoes and early peppers and similar plants may be started during this month in hotbed or glasshouse. Asparagus should be reset, as may horseradish and rhubarb plants. If the warm and timely rains of the past two weeks are continued it will be a busy month for the hoe and hand cultivator.

For forcing lettuce, radishes and other succulent crops when the ground is as cool as it is during January it may be wise to use a small amount of nitrate of soda or other quick acting nitrate which will give available nitrogen and more satisfactory growth.

For the fruit garden this is pruning month. Of course with blackberries, raspberries and other small fruits it is presumed useless canes were removed soon after the bearing period, but if not the long pruning hook used to top trees is excellent for them; one may stand at a distance and hook out these vines. Be careful in dragging them out not to tear off fruit buds of the new growth which is to give next year's crop. If the long hook is not used then heavy leather gloves are necessary. Of course all deciduous fruit trees need some attention at this time of the year. Apricots and peaches and some of the plums may need very heavy topping back. Do not leave long slender limbs to break or bend the tree out of shape.

This is also a good month to start the compost heap. Tomato and potato vines which have been raked up may be composted and used in the garden again but it is perhaps safer with such rubbish to either burn or compost and use on the orchard or small fruits for sometimes fungus or blight spores carried over may be injurious to next year's crop. For the compost heap strawy manure, ashes, scrapings from the poultry yard, leaves from trees, garbage from the kitchen and a thousand and one other things can be used to make a rich dressing for the bed where succulents are to be forced. Where considerable strawy material is used several months will be required before this is in condition for use. A little soil or gypsum mixed with the other material aids in saving nitrogen.

FREE SEED

We have from Congressman Wm. D. Stephens of the tenth congressional district information that congress and the department of agriculture are uniting in rather more practical distribution of free seeds than in the past, at least as to one effort now being made. Instead of the usual little dab of seeds of no particular value there is available sufficient seed of each kind to give a thorough test. For instance, there are to be distributed 365 five-pound packages of feterita, 315 four-pound packages of milo, 35 four-pound packages of Peruvian alfalfa. Seeds will be sent to those who will be interested in testing one or more of these crops, and full instructions regarding the culture of the crop will also be furnished them. Each package contains a sufficient quantity of seeds for a satisfactory field trial. The success and value of the distribution are dependent upon the seed being planted by interested farmers who will follow instructions given by the department in so far as possible and report results.

Those subscribers living in the tenth district should write at once to Mr. Stephens, and we doubt not other congressmen representing other districts can supply their constituents.

GOOSEBERRY MILDEW

English varieties of gooseberries suffer more from the attacks of this fungus than American sorts. The frost-like coating of the parasite appears on stems, leaves and fruit. If the disease occured in the gooseberry patch last season it will be well to spray this spring. As a fungicide potassium sulphide is to be recommended. Use one ounce of the sulphide to two gallons of water. Apply the first spray early in the spring just when the buds begin to open. Follow this with sprayings at intervals of about two weeks until six or seven applications in all have been given. —W. W. Robbins, Colorado Agricultural College, Fort Collins, Colorado.

CARE OF SPRAY PUMP

The external bearings of the spraying machine should be frequently oiled, but care should be taken not to let any of the oil get upon the rubber parts of the machine. The machine should be well washed out with water immediately after use, thoroughly cleaned and dried, and the pump oiled before being put away.

TREES

The Largest and Finest Assortment of fruit and ornamental trees, vines and plants on the Pacific Coast.

No matter what you figure on planting this season, we can supply your orders fully and with first quality trees. Send us your list for prices and suggestions.

Wilson's Quality Trees

Are in heavy demand this season. The selection of buds from established bearing orchards, careful selection of seed, causing healthy, vigorous growth—THE REASON. The following letter is one out of many thousands we have received in the past:

Grass Valley, Calif., Dec. 7th, 1914.

Fresno Nursery Co., Inc., Fresno, Calif.
Dear Sirs: In January, 1912, I received from your nursery 210 walnut trees of three varieties, which I am pleased to say have yielded since the first year of planting, each variety bearing a few nuts of excellent quality and TRUE-TO-NAME. I never lost one single tree of your shipment. The 600 pear trees received at the same time as the walnuts are also very satisfactory. My trees have done so well that the local paper has given considerable space about the vigorous growth of my orchard.
Very truly, (Signed) GORDON S. MORGAN.

That tells the story.—Prospective Planters, give us an opportunity of starting you right by supplying strictly first class nursery stock. Send us a list of your requirements for quotations. Our large 52 Page Book describes all varieties of Fruit Trees, Grape Vines, Ornamental Trees and Shrubs, Palms, Roses, etc. We send this book free upon request. Remember we specialize on **DECIDUOUS FRUIT TREES, CITRUS TREES, OLIVE TREES, FIG TREES, GRAPE VINES, and Hardy Ornamentals.** Write us if you want the best that money will buy. Address

THE FRESNO NURSERY CO., Inc. **300-340 Cherry Ave, Fresno, Cal.**

Kirkman Nurseries
RELIABLE TREES AND VINES

We again solicit the fruit tree and vine orders of the planters of the West, knowing that nothing but the **Best** will satisfy the experienced buyer. Twenty-eight years of successful nursery business has proven the quality of

KIRKMAN TREES

and the treatment Kirkman accords his customers. Our steadily growing patronage has demanded that we grow more stock each year, until we now have more than **five million** trees and vines growing in our nursery plants in California and Arizona. A considerable portion of the stock in our nurseries, which will be ready for delivery this coming winter and spring, is already sold to early customers, but we still have a complete stock of all varieties of fruit trees and vines, as well as a general assortment of **ORNAMENTAL** and **SHADE** trees, etc., etc. What are you going to plant? We have it, without doubt, in large or small quantities. Illustrated price catalog on application. Please mention what varieties you are expecting to use.

BUD SPORTS IN AGRICULTURE

(Continued from Page 5)

instances the entire 11 have been found on single trees, and several of them have been noted on each of the two parent trees from which the entire Navel planting of the state has originated. Two photographs are presented, one showing some of the sports found in the Washington Navel variety, and the other illustrating some of the variations which occur in Valencias.

Not only are these off-type fruits of very frequent occurrence in nearly every orchard, but they persist continually, year after year on the same trees, showing that they are in fact fixed mutations. In addition to this, in every case where one of these sports has been rebudded into a tree of another type, the new head produced by these buds has been identical in all respects with the form from which the buds were taken. This is very strikingly shown in the case of a sport in a Eureka lemon tree, which consists of a fair sized branch bearing green and yellow variegated leaves and striped fruits and branches, the green stripes on the fruits persisting even when they are mature. A standard type Eureka tree was rebudded from this variegated sport, and both the foliage and fruit on the new head are identical with that on the original mutation, so that if they are removed from the tree it is impossible to tell whether they were produced by the original branch or by the rebudded tree.

Not only do bud sports show as variations in color, shape, size and similar characters, but we have many illustrations which seem to prove that the amount of fruit production is a sporting character and one in which there is very great variation. Moreover, from investigations and practical demonstrations now under way, we have proof that this fruitful or shy-bearing habit can be transmitted by budding. Everyone recognizes the variations in yield between different trees, but few have heretofore realized that this character was a constant one with the tree or that it was hereditary.

From careful, individual tree performance records kept for four years in a well-known and profitable Washington Navel orchard, it was found, as reported by Mr. Shamel at the Fruit Growers' Convention at Davis last June, that the difference in actual net returns to the packing house for the fruit from the highest producing trees over that from the lowest producers, was $417.77 per acre annually.

The owner of a grapefruit grove in San Diego County observed that a few of his trees produced large crops of fine seedless fruits while others in the same grove were not only light bearers, but a large proportion of their fruits were of undesirable sizes and very seedy. For planting a new grove, this grower selected buds from two trees in the original plantation, which had been observed to be very large and consistent yielders of desirable fruits. The new grove is now in full bearing and produces uniformly a large crop of seedless fruits of fine shape and size. Mr. Shamel tells us a similar, though much more striking case in which he has been interested in the lemon groves of the National Orange Company at Corona.

These low producing trees have been termed "drones" and "boarders." They have been found to be bud sports of a very undesirable nature, but as they are usually very vigorous and rapid growing, they are always filled with fine budwood. Some budders, finding such trees, have considered themselves fortunate in being able to get their buds with so little effort, but the grower who has tried to pay expenses from such trees has found himself very unfortunate. However, the vigorous character of these trees makes them well adapted for rebudding and they can thus be easily eliminated and the grove changed to a productive one in a very few years by top-working them to standard types.

A letter which appeared in a recent number of the Rural New Yorker, from a grower in Texas, recites experiences with various deciduous trees exactly comparable to the results obtained in our citrus investigations. He said in part:

"Drone trees were discussed on your editorial page recently. Every orchardist has them unless exceptionally fortunate. My own share of them has been more than liberal, and since they are usually of strong and vigorous growth, my plan has been to put new tops on them by selecting buds from trees that are satisfactory bearers. . . . A number of trees on my place—peach, pear, plum, persimmon and pecan—have been treated in this way, and in every instance subsequent fruitage has met expectation. A season seldom passes that one or more trees are not worked in this way. No longer ago than last April, a lusty young persimmon and strong growing eight-year-old Mobile pecan were worked with dormant buds, not because they were drones, for they were both exceedingly prolific, but their fruitage was inferior. The stems of these trees are now bristling with bud-shoots two to four feet in length, while about one-fourth of the original top is still growing and fruiting above. When the remainder of these tops is taken off next spring, those bud shoots will grow surprisingly fast and new fruits will be expected a season later. Then if the new persimmons and new pecans are not approximately equal in quality to those produced by the mother trees from which the buds were taken, it will be the first failure in a long experience. . . . On the drone tree proposition, I am prepared to show the goods in quantity sufficient to convince the most obtuse or incredulous Missourian."

Potato growers are coming to realize the advantages to be gained by the use of selected stock for planting. This is obtained by what is termed hill selection. The highest producing hills are noted and the best potatoes from these plants are used for seed stock. In this way one of the most progressive growers in Colorado has increased his yields ten per cent and, on account of the uniformity and good quality of the crop, he receives 50 per cent more per bushel than is paid for potatoes grown from unselected stock.

If time permitted many more varieties of plants might be discussed which are of unquestioned bud origin. It has been demonstrated that new varieties may originate as bud sports and hence we have every reason to believe that still more forms of more or less value can and will be developed in this manner. However the introduction of new types is neither our desire nor our purpose. What we aim to accomplish is to improve the standard varieties by eliminating the undesirable forms which have become so common among them. One of the common causes of the so-called "running out" of varieties is the condition of their becoming so contaminated with undesirable forms that their uniformity is lost and their production greatly decreased. The purpose of our study of this subject is to enable us to determine how to isolate the standard type of a variety and then to control that type by bud selection so as to hold it true and unvarying. This means a greater uniformity of the crop and a greatly increased production without an increase of the acreage planted.

Ex-President Roosevelt grasped the real significance of this investigation and expressed it very tersely in conversation with Mr. Shamel last year when he said, "What we need in American agriculture and horticulture is a fuller development and more complete utilization of the crops and plants we now have rather than the introduction of any new varieties.

FARMERS' CONGRESS

The president of the Colorado Farmers' Congress has called for the next annual session to be held at the Colorado agricultural college, Fort Collins, on June 11, 1915. Various live stock and other agricultural and horticultural associations of the state of Colorado are entitled to three delegates each at this convention. The secretary is Mr. M. N. Dillon, Fort Collins.

PLANT APRICOTS

Consider these facts—
Market—The entire world.
Demand—Steadily increasing.
Supply—Grown commercially only in California.
Profit—From $175 to $300 an acre.

Weigh the evidence, and your own good judgment will tell you to plant

SILVA-BERGTHOLDT'S
Foot-Hill Grown
Apricot Trees

Prized for their thrift, hardiness, good root systems and freedom from disease.

Though we have an extra fine block of Blenheims, Royal, Newcastle Early, Moorpark, Routier's Peach, and Tilton on Apricot, Peach and Myrobolan Root, a shortage of good stock is expected this year, so order now and get choice trees.

SANITARY SCHOOLS

An eastern writer says that societies for the bettering of conditions in penal institutions have brought about in most states a good condition of jails and penitentiaries which is most humane and sanitary. Drinking fountains of approved pattern add to the comfort and even happiness of inmates. Then he describes the country schools in many sections where the old tin dipper does duty for the entire school and outbuildings are maintained in a most unsanitary condition. The pertinent question is asked, "Are not the pupils in our public schools worthy as much consideration as the inmates of our penal institutions?"

FILE THE CULTIVATOR

We did not call attention on last week's editorial page to the index to Volume 43. We did not need to for it speaks for itself with nearly ten columns of fine type giving the contents of the 27 papers making up the issues of the past six months. The index is arranged as to topics and as there was much material used during this period which can be found in no other publication it is well worthy of preservation. It is perhaps a little late to make New Year's resolutions, but it is still in order for every subscriber who has not preserved his files in the past to make a resolution to immediately construct a shelf on which every issue of the Cultivator during the next year shall be preserved. The paper is too large to make a convenient volume for binding, though some of our subscribers do keep it in this permanent form, but it may be at least preserved. The last number of every volume will always contain this index topically arranged so that any subject may be immediately referred to.

SAVE THE WASTES

We have often referred to various methods of making available some of the waste products of orchard and farm and much work has been done along that line during the past year. Now comes suggestion for a new source of wealth in the Salton Sea. The encroachment of this sea on agricultural lands and on the railroad right of way has done so much damage that there should be some return. And it is now promised, for we note there is to be constructed a fertilizer plant which will consume some 20 tons daily of fish from the waters of the Salton Sea. It has been said that the waters of this strange inland lake will "assay 20 per cent carp." As it will be some years before its waters are dried up—if ever they are—it is presumed the fertilizer works will have abundant material to work on for many years to come.

HANDS OFF

It is predicted that there will be all kinds of anti-alien bills presented before the state legislature which convened last Monday in Sacramento. There is no crying need at this time for any of these bills to be presented and without question every one of them will be turned down. The legislator who may wish to make good with the agitator and jingo can do it by the presentation of such a bill. With the world in its present warlike attitude it is unfortunate to press such matters and it is to be hoped that common sense may prevail and these bills be suppressed as quickly and as quietly as possible.

It is not to be presumed that this state will change its present attitude on Asiatic exclusion, but there is a reasonable time for all things and certainly the present is not the time when such agitation will lead to success and it may lead to injury.

GIVE THEM A CHANCE

We recently referred to the agricultural club which is maintained in San Quentin prison for the benefit of those who wish to fit themselves for useful work when they are released. The club is being aided in this work by the university of California and a number of inmates of the institution are receiving material benefit. We now note in the monthly of the San Diego farm bureau that No. 7313 is making application to the San Diego County farm adviser for work subsequent to his release on parole. In this particular case 7313 is a machinist, but we doubt not there are all kinds of workers among members of the farm club to which we refer. There are but few employers who will be able to give encouragement to this class of labor, but those who are so situated that they can may benefit materially a fellow being and it is very probable will have a thankful service rendered which will be equal to any which may be secured.

ANNUAL REVIEW

The California Fruit Grower, for the past quarter of a century the organ of the fruit packing and marketing interests, and for the past few months known as the California Fruit News, has had a custom for many years of issuing its annual review of fruit conditions of California and the Pacific Coast. These annual numbers have been the most pretentious of any publications of its kind on the coast, but the one for the year just ended excels all former numbers. It has 84 pages of heavy coated paper filled with statistics of the year's fruit business, trade conditions and announcements of packers of California products and eastern handlers, touching upon fruit trade conditions of the past year. Reference is made to the fact that there have been many difficulties confronting the trade, but most of them have been overcome, and on the whole the year has been most successful in the fruit trade industry. By-products it is predicted will be developed until they will save millions of dollars to California producers. The fruit canning situation is reviewed, as is the salmon industry, condition of the walnut market and the outlook of the asparagus canners, any many other topics. Of course the greatest one feature in the paper is the announcements of large concerns han the asparagus canners, and many sections of the United States. The paper is edited by Howard C. Rowley, whose father founded it.

1915

California, and we hope all the rest of the world, has been looking forward to 1915 with the expectation of great things doing. It is the year of the great expositions. The enormous sum of $50,000,000 is being spent on the great one in San Francisco. To most of us this sum is beyond comprehension and to all of us descriptions of what has been accomplished are of little value. To get any idea of the greatness of the Panama-Pacific one must stand on the hill tops near the Presidio and look down upon the wonderful coloring of the world's fair buildings. The exposition will open on February 20.

The San Diego Exposition opened on the evening of December 31, or rather at the moment of midnight on the morning of January 1. Thousands of people from many parts of the world were there to honor the opening ceremonies. The president of the United States in his mansion at Washington pressed the button. His representative, Secretary McAdoo, with his wife, the president's daugnter, was present and joined in the opening ceremonies which lasted for several days, and report tells us that at this writing the exhibitors are settling down to the routine of the great exposition which will continue for 12 months, for it will not close until midnight of December 31.

These two great expositions are not to be compared for they are along materially different lines. San Diego's exposition is more the exposition of the west, of the Americas, than of the world. Its site in Balboa park and its architecture and coloring features all have a touch that is strictly American. In beauty of setting the world has never seen anything more perfect. It is not so near the blue waters of the ocean as is the Panama-Pacific whose entire grounds front along the great bay and harbor. At San Diego the harbor is in full view from many parts of the grounds though it is several blocks from the entrance. See San Francisco's international exposition to appreciate the wonderful advancement of the arts and sciences throughout the world; see the San Diego exposition to view America at its best.

The interstate commerce commission has ruled that the proposed increases in rates on fresh fruits and vegetables from points in California to Seattle and Tacoma are justified.

Agricultural Notes

"Fowl yaws" is the rather appropriate sounding name given to chicken pox in the West Indies.

There are now 1,000 counties in the United States which are employing farm advisers on full time.

It is being proposed to pack Florida grapefruit in half-bushel boxes to increase the demand for that fruit.

Wisconsin, it is stated, produces one-half the cheese supply of the nation and one-sixth of its butter.

The area sown to rice in India for the season 1914-15 is at least five per cent greater than last year's acreage.

Boston shipped last week a big cargo of eggs to Europe. It consisted of 12,000 cases. Many heavy egg shipments have been made for the past two months.

Canadian census returns of 1911 show the Yorkshire to be by far the most popular breed of swine on Canadian farms. The next in favor is the Berkshire.

Special train loads of mules are being moved out of the southern states in record time. They are bound for seaports for shipping to the European war fields.

To aid in the fight against the foot and mouth disease the Southern Railway has released three of its livestock agents to the service of the United States department of agriculture.

Careful experiments with Turkestan alfalfa, made by agricultural experiment stations of Hungary, show it far inferior to the variety commonly raised in that country and called the Hungarian.

The dairy industry of Great Britain has been steadily increasing during the last 20 years. Milk selling is often referred to as "the sheet anchor" of the British farmer. The favorite breed is probably the dairy Shorthorn.

The United States this year has produced the greatest crop of cotton in its history, more than 16,000,000 bales. Texas leads with an estimated production of 4,560,000 bales. California comes very close to the bottom of the list with a production of 37,000.

An article in the Tropical Agriculturist for September 1914, forecasts many new uses for rubber: Wherever leather is used today rubber will soon prove a formidable rival; as a competitor of lumber—hadwood flooring, shingles, boat planks; as a rival for steel springs for cars.

The executive committee of the Chicago Association of Commerce has adopted a resolution in favor of setting the clocks throughout the nation ahead one hour in order to secure more daylight after working hours in the summer months. The resolution also asked the United States chamber of commerce to consider the question at its annual meeting in February, in Washington, with the idea of bringing about a nation-wide movement in favor of the change. A special committee of the association held a meeting last week to consider a plan for adopting eastern time for Chicago instead of central, but so much opposition was expressed by railroad men present, on account of the confusion which would result if Chicago made the change, that it was decided to push the movement along national lines.

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County reports a very successful production of broom corn.

There was a largely attended meeting of olive growers at Yuba City on December 22.

Over 3500 cases of Chinese eggs were received in the port of San Francisco the end of last week.

Farmers of the Ukiah Valley have organized a farm bureau center with J. C. Johnson as president.

A Shasta County alfalfa grower has just mailed a ton of alfalfa seed by parcel post in 50-pound bags.

It is announced that the Ehman Olive Company of Oroville will plant 500 acres to olives this spring.

The orange season in northern California is practically ended. The crop has proved larger than was anticipated.

A crop of olives near Natomas, Sacramento County, recently brought the owner $180 per acre from six-year-old trees.

The Santa Rosa cannery handled over 7,500 tons of fruit during the past season. Tomatoes were the heaviest crop.

A potato grower at Grass Valley, Nevada County, recently produced $138.82 worth of potatoes from a quarter-acre of ground.

Hop growers of Sonoma County met recently at Santa Rosa and organized a county association, with a capital of $500,000.

Towns in various parts of the Sacramento Valley are working to secure visits from delegates at the next National Irrigation Congress.

A sheep producer near Willows, Glenn County, recently lost 200 sheep from bloat caused by eating growing barley in a field to which the flock had secured entrance.

Dairying has received a great impetus at Girvan, Shasta County, through the building of several silos. A milking machine will be used on one large dairy just established.

The members of the cow testing association at Gridley, Butte County, are highly pleased with the success of the association in showing the true worth of the cows and their dairies.

There will be an exhibit at the San Francisco exposition of matured bananas grown in the foothills of Tulare County. The grower has a bunch of 30 trees which bear satisfactorily.

The Northern California Stockmen's Association held its annual meeting at Redding December 23. One of the most important items of business transacted was the authorization of a lease by the executive committee of pasture lands of the railroads in northern California.

At the recent annual meeting of the Northern California Stockmen's Association the following officers were elected: President, William Junkans, Redding; vice-presidents, Mrs. Rhoda B. Menzel for Shasta County, James Long for Tehama County, J. B. Parker for Siskiyou County; secretary, M. D. Lack; treasurer, George A. Grotefend.

Central California

Orange picking in the Porterville district has been considerably retarded by rainy weather.

Santa Clara County has the largest acreage planted to cherries of any county in the state.

Pupils of the schools of Orosi, Tulare County, will make extensive plantings of native poppies.

Fresno County is collecting a fine citrus exhibit for the Panama-California Exposition at San Diego.

Apples and celery are both being shipped in large quantities to eastern markets via the Panama Canal.

Lindsay, Tulare County, shipped from 50 to 80 cars daily during the the heaviest part of the orange season.

This year's coldest day for the San Joaquin Valley was December 22, the thermometer in some sections dropping to 25.

To secure payment for fumigation County Horticultural Commissioner Collins of Tulare County has filed liens on crops of 15 growers.

Forty per cent of the raisin crop of California has already been shipped out of the state, according to figures of the Associated Raisin Company.

Growers of Kingsburg, Fresno County, are still working to secure a cooperative cannery which will have a selling commission in connection with it.

Several hundred acres in the south San Joaquin have been contracted for sugar beet growing the coming season. The Spreckels company making the contracts guarantees a $5.50 per ton flat rate.

Fresno is passing the contribution box to raise a fund that will justify its inviting the International Irrigation Congress of 1915 to come to Fresno. The plan is to have the delegates spend one day there.

According to figures recently given out it is determined that the total cost to citrus growers of the protective system this year used for shipping oranges will not be more than one-fifth of a cent per box.

The convention of the State Irrigation Districts' Association was held in Fresno the middle of December. The principal resolution passed was favoring legislation to make irrigation district bonds more saleable.

A bill has been introduced in congress providing that desert land settlers in Fresno and Kings Counties who have not been able to secure sufficent water on their lands at the expiration of the four-year term be allowed a further extension of three years.

At the recent annual meeting of the Porterville Poultry and Pet Stock Association plans were discussed for the next show and the following officers were elected: Lacy Threlkeld, president; T. M. Slusser, secretary; Edward Bennett, treasurer; E. D. Fawcett, exhibition manager. Standing committees include J. H. James, Leslie McAuliff and Robert A. Mack on publicity, and J. P. Holden, W. S. Hayes and Harry Claubes on finance.

Southern California

Redlands shipped 250 cars of fruit in its Christmas pool.

San Fernando's lemon day sale brought a total of $231 for charity.

A second investigation of the Lima Bean Growers' Association is rumored.

Orange County's board of forestry will do its first tree planting in the Garden Grove district.

San Bernardino County's new trout hatchery has been finished. It is located in Bear Valley.

Heavy shipments of cantaloupe seed are being received in Brawley. Planting has already begun.

A Chino stock man has just received two carloads of Holsteins and Jerseys from Port Angeles, Washington.

People at Monrovia are actively at work plowing, harrowing and planting vacant lots to wild flowers.

The production of pimientos in the Garden Grove district of Orange County will reach approximately 1400 tons this year.

Beekeepers of California are holding on to their honey crop until prices show some indication of coming up to a reasonable basis.

The San Fernando Citrus Growers' Association has elected Thomas Knox president, Fred Norcum vice-president and W. S. Shoemaker, secretary.

Horticultural Commissioner Beers of Santa Barbara County has been gathering large quantities of carob beans for distribution in his county.

The 1914 citrus crop will bring to the state about $33,000,000. One hundred and fifty thousand people earn their living through the citrus industry.

The orange show association of San Bernardino has appropriated $19,000 for expenses of the exposition which will be held in that city February 17-24.

It is estimated that California's production of beet sugar for the year will reach 3,500,000 bags. Thirteen sugar factories were operated this season.

The Inglewood high school in Los Angeles County has secured a tract of ten acres near the school building, the ground to be used by classes in agriculture.

Owners of orange and lemon groves in Yorba Linda have been very much worked up over the attempt of oil locators to do assessment work on their lands.

Fears of shortage of beet seed for the season's planting have proved groundless; shipments from Germany have already been received and more are on the way.

President O'Niel of the California Vegetable Union states that Southern California's shipments of vegetables for the season will total 6000 carloads. Two thousand five hundred cars are of celery.

A new prize has been announced for exhibits at the National Orange Show at San Bernardino in February. This will be $10 for a box of navel oranges testing the highest percentage of soluble solids to acid.

The Coast

Eggs are retailing in Spokane at 65 cents.

Farmers of Willcox, Arizona, met Farm Demonstrator Paschall at Willcox December 30.

Wheat prices in Portland last week reached the highest price during the season, $1.18 being offered.

A new creamery has been opened at Dillon, Montana, 283 cows being pledged toward its support.

Washington produced during the past year 22,680,000 pounds of butter, valued at nearly seven and a half million dollars.

Range cattlemen of the Gila national forest of Arizona met at Silver City and perfected a strong organization recently.

The glut of apples in the eastern market is being lessened and better prices are being obtained for eastern Washington fruit.

The Inland Empire Poultry and Pet Stock Show ended at Spokane last week with the largest exhibit yet made by that association.

Arizona was visited by very heavy rains during last week and damage to the extent of millions of dollars was visited upon many sections.

Considerable damage has been done in southern Arizona by floods caused by the exceedingly heavy rains of the latter part of December.

The Northwest Live Stock Association, recently assembled in convention at Lewiston, Idaho, elected E. S. Sweet of Grangerville president.

An Oregon nursery is selling large numbers of filbert trees. It is said the soil and climatic conditions of Oregon are just right for producing that nut.

The annual convention of the Arizona Cattle Growers' Association and the Cochise County Stock Growers' Association was held at Douglas, January 4, 5, 6.

The Washington State college is encouraging the formation of turkey clubs in different sections of that state. North Yakima already has one thriving club.

The Oregon butter and cheese makers met in annual convention at Portland last week. O. B. Neptune of Albany was elected president for the coming year.

The grand champion steer at the recent Portland Pacific International Livestock Exhibition commanded $24 per hundred. Sales of fat cattle aggregated $250,000.

A plant has been constructed at Wenatchee, Washington, by the Sumner Fruit Growers' Association which will operate as a cannery and preserve waste products of that section.

During the recent convention of the Northwest Live Stock Association at Lewiston, Idaho, there was organized The Pure Bred Live Stock Association. The membership is composed of Washington breeders.

North Yakima has been chosen as the next meeting place of the Washington Irrigation Institute. The institute urges location of agricultural experiment stations in irrigation sections of the northwest.

How Many Hides Has a Cow?

SOLE leather is not adapted to soft, tufted upholstery of automobiles and furniture.

Hides must be split into thin sheets to produce upholstery leather.

The two lower, fleshy, grainless sheets are coated, embossed, and sold as "genuine leather." That is why so much "leather" upholstering cracks, rots and peels so quickly.

DU PONT FABRIKOID

FREE—FARM ACCOUNT BOOK

Know How Much You Make This Year

No one shall pay a cent for Bickmore's Farm Account Book. Mr. Farmer, simply send us your name and address. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborer's time record; and section for personal accounts. 64 pages; for ink or pencil. Not a cheap affair. Its quality is in keeping with

BICKMORE'S GALL CURE

A soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. Get full value out of yours. Bickmore's Gall Cure heals and cures Harness and Saddle Galls, Rope Burn, Cuts, Scratches, Grease Heel, etc. Keeps them sound and in condition for work. You don't have to lay the horse off. Bickmore's Gall Cure cures while the horse works. Great thing for sore teats in cows. Look out for substitutes and cheap imitations. Be sure to ask for Bickmore's Gall Cure at the store. The work-horse trade mark on every box. Farm Account Book is ready. Send today.

BICKMORE GALL CURE CO. Box 89 Old Town, Maine

Live Stock and Dairy

THE DAIRYMAN'S RELATION TO QUALITY

By L. M. Davis

QUALITY is the keynote of a permanent success. Though the individual dairyman may doubt this, its truth is established when the dairy business of the whole of California, present and future, is considered. Failure to realize what constitutes success, refusal to meet the obligation which every dairyman owes to the dairy industry, and competition are at least three conditions which have brought upon dairymen of this state the great problem of how quality can be raised, for the place has been reached where improved conditions must prevail, lest the business suffer materially through a more serious quality situation than was anticipated would exist even at this time. During 1912 an average score of but 91½ points was placed upon over 150 lots of butter sent to be scored at the university farm at Davis, and of this number less than 30 per cent scored 93 points, the requirement for the highest market grade known as "Extras." The percentage of "Extras" changing hands on the principal butter markets is even lower than this, and less than ten per cent of the butter sold in these places will so qualify. The cause for this condition is the improper treatment which milk and cream receive before being placed in the hands of the manufacturer.

Every person who handles milk or cream knows that they are perishable products which require special care. Failure to observe the necessary precautions in handling these products must therefore be considered as a disregard of the principles underlying quality. Were dairymen to apply themselves closely in two particulars, over 90 per cent of the quality troubles would disappear, and this raised standard would be accompanied by a corresponding gain in net profits. Cleanliness and low temperatures are two features the abuse of which leads to low grade dairy production. A large percentage of the bad flavors in milk, cream and butter are the result of dirt, manure, hair and flies getting into milk during the milking process, and this becomes the more serious for the reason that 75 per cent of these contaminating materials go into solution and can be removed in no way, but remain to cause the development of unfavorable fermentations which produce bad flavors in the market production. The results of the butter scoring contests show that 80 to 90 per cent of the criticisms made in California creamery butter are due to defective methods of handling cream before it reaches the creameries.

Dairy conditions which need improvement include not only the maintaining of more sanitary dairy barns, more attention in the matter of cleaning cows previous to milking, clean milkers, properly constructed and cleaned utensils and more care in washing separator bowls, but the length of time and the manner in which milk and cream are held. Along with cleanliness must be the other desirable feature, low temperatures. While the market milk dairyman realizes this to some extent on account of his product being more perishable, the dairyman who sells cream often fails to appreciate the advantage of cooling cream immediately after separating, and thus a condition most favorable to deterioration begins to exist shortly after the milk is drawn. Freshly drawn milk is at an optimum temperature for bacterial growth, and unfavorable fermentations can be checked in no better way than by immediate cooling. If the milk is to be separated, skimming should take place directly after milking, but the cream should be cooled before being mixed with previous skimmings. A tank cooler is so inexpensively constructed and operated that there can be no reasonable objection to its use. Such a cooler may be made from a box or barrel and should be provided with an inlet at the bottom and a discharge at the top. Ordinary milk cans are successfully used as containers, and the water used in cooling may be run into a stock tank. Low temperatures of themselves are effective in helping preserve quality, but an ideal product results when they are accompanied by cleanliness in production.

Careless practices on the dairy favor the adoption of burdensome regulations. With ideal methods in use such would be eliminated, and expensive, artificial processes, such as pastuerization, would be unnecessary. Improvement in the quality of dairy products must begin with the producer, so the dairyman holds the key to the situation. Every effort of the consumer, the distributor, or the manufacturer, will work to his ultimate benefit. Where payment on the quality basis is established, a premium of three to five cents per pound of butter fat is given for cream of highest grade. Such cream can be produced best by paying close attention to cleanliness and immediate and thorough cooling. Were the matter of quality carried to the point where milk and cream would be produced under conditions which prevail upon certified dairies, it would represent an impossible expense, for excessive prices could not be obtained. But this extreme is unnecessary, and the dairy business of California would receive a wonderful impetus if the bulk of our dairymen would but observe the conditions which they know should prevail.

AMERICAN MILCH GOAT RECORD ASSOCIATION

The tenth annual meeting held in Chicago, December 1, 1914, President Professor Francis King Cooke presiding, considering the abandonment of the International Stock show, was very enthusiastic. Mr. D. O. Lively, secretary of the livestock exhibits of the Panama-Pacific Exposition was present and suggested that J. C. Darst, secretary of our Record Association, act as superintendent of the milch goat exhibit. This is the only milch goat record association in the United States, hence there will be only one superintendent.

The secretary was authorized to correspond with the Hon. Holmes Pegler, secretary of the British Goat Society, London, England, the hon-

orable United States consul at Bern, Switzerland, and others for the purpose of obtaining the services of a competent judge of milch goats for awards to be given at the Panama-Pacific Exposition.

Milch Goat Show to be held from October 27 to November 7, 1915 at Panama-Pacific Exposition. The annual meeting of the American Milch Goat Record Association will be held Wednesday, November 3, 1915, in Congress Hall, exposition grounds, during afternoon.

To be eligible for this exposition all goats must be registered in the registry of the American Milch Goat Record.—J. C. Darst, secretary, Dayton, Ohio.

Grade, native goatlings and doe kids need not be registered. No does that have kidded under two years of age will be eligible for this exposition. First, second and third awards for each class. First award in classes one, two and three will designate championship in that class.

Classes

First class—does, two-year-old or older that have kidded.

Second class—Goatling does, one-year-old and under two years, that have not yet kidded.

Third class—Kids, does six months old and under one year, that have not been bred.

Fourth class—Six does in milk, three does with kids, at foot, milk yield of milking does to count 50 per cent.

Owing to the fact that the male goat has a strong odor which is disagreeable to many people, no male goats will be eligible for this exhibition but milch goat breeders are requested to send photographs of their bucks and also milking records of does sired by their registered bucks.

Breeds, eligible for this exhibition—Anglo-Nubian, Guggisburger, Saanen, Toggenburg, native does and grades of above breeds.—J. C. Darst, secretary.

WORLD'S RECORD

We are writing you with reference to a news item which appeared in your paper under date of December 3, entitled "Another World's Record Broken."

That you may be rightly informed on this matter we beg to state that the record which you speak of is a world's record (senior three-year class) for the Holstein breed only and that the Guernsey cow, Dolly Dimple, leads all other breeds for this division with a record of 18,458.8 pounds of milk and 906.89 pounds of butter fat which would be equal to 1132 pounds of butter, as the Holstein breeders figure it.

We commend the Holstein breed on the remarkable record of Duchess Hengerveld Korndyke and upon the remarkable showing they are making with their yearly tests.—The American Guernsey Cattle Club, by C. H. Hulburt.

INDEX TO GUERNSEYS

A complete and extensive, yet compact, alphabetical index of all registered Guernsey cattle has been published by the American Guernsey Cattle Club, Peterborough, New Hampshire.

This contains four sections. In one division of one section appear the names and numbers of all bulls, alphabetically arranged, which are registered in the 28 volumes of the Herd Register now published. The other division contains a similar list of cows, making a total of 27,000 bulls and 48,000 cows which appear in these two lists. Another section contains an alphabetical index of all cows which have entered the Advanced Register up to 2500. The third section contains an alphabetical list of the Advanced Register Sires. Another section of great service to Guernsey breeders is the giving of the errata of the previous volumes of the Herd Register.

The blessed work of helping the world forward happily does not wait to be done by perfect men.—Eliot.

THE FARM HOSPITAL

Written for California Cultivator
By Sacramento Valley Contributor

Every farm should have an animal hospital, where really sick animals can be cared for and nursed back to health and where those suspected of having some disease or any "off color" in any way may be put away from the balance of the herds and flocks.

There are many reasons for having such a place. First, there is the control and check of contagious diseases that might be accomplished by promptly isolating the first prospect and taking vigorous preventive measures with the balance. Thus many young pigs or calves that get "a bit off feed," continue to decline if kept with the balance of the herd because of their inability to "rustle" their share with their healthy, husky mates. If such are put by themselves and given special care and food for a few days they are soon back to normal and go on without serious set-back.

This quarantine place should be a shed or building that is light, clean and comfortable, and one that can be thoroughly disinfected. It should be apart from other buildings and so situated that animals other than those quarantined can not have access to it.

The control of one outbreak of disease or the added gains on a few young animals will pay for such a building.

MILKING MACHINES

The present day milking machines are such an improvement over the old-time machines that they may now be considered beyond the experimental stage. When first put on the market, they naturally had a number of serious imperfections. These have been almost entirely overcome by the inventive ingenuity of man, so that today it may safely be said that the most modern of them are a success.

The two chief stumbling blocks were keeping the machine clean and avoiding injury to the udder of the cow. It is true that in the hands of a careless operator they are still subject to criticism along these lines, but it is the fault of the operator, and not of the machine. It will no doubt always require more intelligence and judgment to operate them than is generally displayed by a large percentage of our hand-milkers. When in the hands of careful men they are a success.

It would be difficult to foretell what the future has in store for the dairyman with the milking machine to do his milking. Nevertheless, the most difficult problem, that of hired help, should be at least partially solved. If there is any one drawback to dairy farming, it is this one of keeping competent and reliable help. All other irksome farm operations seem to have been benefited by mechanical invention, but milking, the most despised of them all, seems either to have been neglected, or to have been the more difficult to solve. Men hate the monotony and regularity of hand-milking. Perhaps mechanical milking should prove more popular, as the amount of time and physical exertion is greatly decreased. Already a great many have been installed in some of our best dairies, and their success there is being watched with much interest by farmer dairymen.—H. E. Dvorachek, Colorado Agricultural College.

AYRSHIRE BREEDERS' ANNUAL

The 40th annual meeting of the Ayrshire Breeders' Association will be held on Thursday, January 14, 1915, in New York, to hear the report of the secretary-treasurer, the advanced registry report and the report of the executive committee. Matters pertaining to the Panama Pacific Exposition will be discussed at this meeting. —C. M. Winslow, Secretary.

40 Acre Equipped Farms

On every 40 acres we install a pumping plant, provide trees and seed adapted to the soil, and necessary farm implements to begin your work.

This establishes you at once on good land in the early fruit district of the upper Sacramento Valley, and assures crop returns the first year. Every one who wants a farm should investigate this offer. Write to.

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powder-paint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 163 North St., Adams, N. Y., and he will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write today.

SPECIAL SALE of Farm Implements

Startling reductions in many lines. We are preparing to move from one of our warehouses into a new one and find hundreds of items that we wish to close out rather than move. Prices are sharply reduced for quick sales.

PLOWS, HARROWS, LAND ROLLERS, RIDGERS, DRILLS, TRANSPLANTERS, CULTIVATORS, MOWERS, RAKES, FEED CUTTERS, CREAM SEPARATORS, BARN EQUIPMENT, GAS ENGINES, SCRAPERS, VEHICLES, WAGONS, TRUCKS, GARDEN TOOLS, MILK CANS, PAILS, ETC.

We can only give you a rough idea of the principal items. Not all styles or sizes are included, but plenty for you to pick from. You can save money on almost everything you need—but remember, the quantities are limited. Make up a list of what you need and write or call and see us.

Please remember that we are not moving our office and salesrooms—merely one of our warehouses. You will still find us at the same old stand.

Water for the great

San Francisco Fair

to be supplied by Krogh Pumps!

The managers of the Panama-Pacific Exposition have installed Krogh Pumps for supplying all the water for the great Fair. This requisition was the result of the most discriminating tests possible. There could be no guesswork in regard to the water supply—consequently Krogh Pumps.

In your irrigation work you can be equally sure of your water supply if you will install Krogh Pumps. For every depth of well—Turbines, Horizontals and Verticals. Our "Field" Engineers will advise you in selecting your equipment if you wish. Write Krogh Mfg. Co., Los Angeles or San Francisco, for complete information.

Alfalfa Seed

Every field where Seed we offer for sale was grown in 1914 was thoroughly inspected by us for dodder, noxious weeds, etc., before it was harvested.

Everything we offer has been government tested to make our assurance doubly sure, both as to germination and foul weeds.

We are actually offering California's best product.

If you are looking for cheap, unreliable stuff, you will have to look elsewhere, but if you want good seed at an honest price we can serve you.

Samples, prices, etc., on application.

Sweeny

I have a young mare with a sweeny as large as my hand behind her right shoulder blade. She has done very little heavy work and has not been injured that I know of. What is the probable cause and a cure?—Subscriber, Thalheim.

Sweeny is only caused in one way, that is by a sudden jerk or strain; by the horse slipping or the vehicle to which the horse is hitched striking some solid object. It may not be noticed much at the time or may be enough to cause severe lameness. In time the muscle atrophies and the only remedy is to apply enough irritation directly to the muscle to cause it to fill up and remain so. A good treatment for sweeny is to put a tape about an inch wide under the skin the whole length of the muscle that is affected. Cut a hole in the skin about an inch long at the upper and lower end of the sweeny and with a blunt needle threaded with the tape pass it under the skin from the upper to the lower opening. Draw the tape through and tie large knots on each end so it can not come out. The tape should be oiled with castor oil and turpentine before using it and it should be moved up and down every day until the muscle fills up to its natural size. Then remove the tape and wash out the canal with a good antiseptic solution. Another good treatment is to inject with hypodermic syringe a solution of equal parts of alcohol and turpentine into the muscle in several places. Once the muscle is filled up it will probably stay so. To soften the skin keep it well greased with lard. You really should have a veterinarian treat it as it will require skill and instruments that you would not have.

Black Leg

In the past ten days I have lost three calves, two about ten months old and one about six months old. One was dead when found and the others did not last long. They were in good condition. On opening them we found the middle stomach entirely dried up. All three just alike. Have been told it is "Dry Mern." The calves had access to an alfalfa field and also a dry pasture but they seemed to prefer the pasture which is salt grass, sage and weeds. Do not know which kind they have been eating. There have been heavy frosts. The weeds have lots of seed which they seem to prefer. Have also been feeding millet hay. I tried to make the smaller calf stand but it seemed to have no use of its hind legs. In skinning them I have found the hind quarters very badly bloodshot as though beaten with a club. Can you tell me what this is and if I can do anything for it? Would it do any good to remove them from pasture and feed alfalfa hay and millet?—Subscriber, Yermo.

Your calves died of the disease called black leg. There has been no cure found for that disease but it can be prevented by vaccinating. It is due to a germ that is found in some pastures. The disease runs its course and causes death so quickly that there is little time for treatment. It attacks young cattle between the ages of six monhs and two years, is seldom seen in older cattle. It is only seen in summer and fall so it will be best to have all your young stock vaccinated every year in the early part of the summer. The first thing for you to do is to remove the young stock to another pasture and vaccinate them now, and again next spring Your nearest veterinarian can do it for you and show you how so you can do it for yourself in the future. You should not skin the calves as it will only help to spread the disease. The carcasses should be burned or buried deep and plenty of lime sprinkled about the place. Fortunately this disease does not attack human beings.

Correction—Goat Fails to Breed

In the reply to "Goat Fails to Breed" on page 681 of last week's paper a typographical error was made. "Mix and divide into 94 powders" should have read "mix and divide into 24 powders."

"What is a cabaret?" asked the Elk delegate from Steamboat Springs. "It is the thing," replied the hard-faced Denver man, "that put the din in dinner and took the rest out of restaurant."

Little Willie, aged three, came in bringing a scratched finger for peroxide and consolation. "I cut it on the cat," he explained.

MORE POTASH COMING

American crops and soils are still as hungry for Potash as before the ou break of the European War, which cur tailed the Potash shipments.

Some of the Fertilizer Companies are trying to induce farmers to buy the one-sided low Potash or no Potash fertilizers of a generation ago. This means a fertilizer that is profitable to the manufacturer, but not the best for the farmer. When the Syndicate in 1910 started the direct sales of Potash to dealers and farmers at reasonable prices. Potash sales increased 65 per cent in one year, a clear proof that farmers know that Potash Pays. They know that Potash gives good yields, good quality and resistance to plant diseases.

Many of the Fertilizer Manufacturers are willing to meet the farmer's wishes and sell him what he thinks he needs. These manufacturers are now willing to furnish as much Potash as they can secure. They offer goods with 5 per cent and even in some cases 10 per cent Potash, if the farmers insist on it.

Shipping conditions are improving, more Potash is coming forward although the costs of production and transportation are higher. The higher price of fertilizers is not due wholly to the slightly higher cost of Potash. Much of the Potash that will be used in next spring's fertilizer had reached America before the war started.

There is no substitute for Potash.

We can no more return to the fertilizer of twenty years ago than we can return to the inefficient farm implements or unprofitable livestock of that period. H. A. HUSTON.

Property of Wife

When man and wife buy a ranch, each paying half for property and having the ranch recorded in wife's name, what part of property would a child by former marriage of husband get at husband's death? Should the wife die first what would be husband's share in property, also wife's at husband's death?—Subscriber.

Where real property stands in the name of the wife it is the presumption that it is her separate property. It is a presumption that would require the introduction of evidence in court to overcome. Upon the death of the husband the wife would receive one-half of his interest in the property and the child the other one-half. Upon the death of the wife the husband would receive one-half of her interest and the wife's family the other one-half.

Forcing Payment

C instructs E to sink a well for D on a certain piece of land bought or bargained for by D through B. E sinks the well as instructed by C. In the meantime D gives up his contract and the land with the well on it goes back to A, with the work on the well unpaid for. D refuses to pay for the work, so also do A, B and C. Is there any process in law by which E can force the payment for his labor, and which would be the proper one to proceed against? Can a contractor's lien be taken on the land, the work being done by the day at $6.50 per day?—Subscriber, Galt.

E may avail himself of the machanic's lien law, filing his lien for the contract within 60 days after completion of the work; he is entitled not only to foreclosure upon the land but also to a personal judgment against the parties employing him; if he can prove that C was acting as agent of A and B he can hold A and B.

Rent or Vacate

Tenants two months in arrears with the rent have not even made a partial payment. How can I collect it or how do I proceed to get them to vacate the house? Will a written notice sent through the mail be all that is required or how many days' notice do I have to give them?—Subscriber.

If the property is rented upon a lease, oral or written, a three days' notice, signed by the owner, describing the property, requiring payment of the rent and stating the amount which is due, may be served upon the tenant personally or by leaving copy with some person of suitable age and sending a copy through the mail addressed to the tenant at his place of residence. Thereafter if the tenant does not vacate, suit may be brought and upon judgment the constable will put the tenant out of possession. In practice a three days' notice is usually sufficient to get your property.

Pipe Line

A piece of land is purchased under contract which reads "rights-of-way four feet wide along all lines of lots herein described where practicable, and where not so, elsewhere over said lot, so as to cause as little inconvenience as practicable for the construction, maintenance and operation of pipe lines and conduits for the carriage and transportation of water." It would have been possible for the water company to lay their pipe lines elsewhere, but instead they took an easier course diagonally across my property. In making a fill I exposed the company's lateral. Whose place is it to lower this lateral?—Subscriber, Whittier.

It is probable that the company would insist that they were bound only by the condition of the property at the time it was sold to you and are not responsible for your taking away the soil over the lateral. You would have no right to lower the lateral yourself, but by treatment of your land you could probably make it advantageous to the company to do the work themselves. It does not appear that you have any legal right of action however.

Collecting Loan

A lets B have a certain sum of money as a loan, without promissory note. A writes B demanding payment; B in return writes that he is going east and A may get his money sometime. The only papers A has to show that B got the money is a check made to B and letter from B saying he will pay the money. What steps shall A take to compel B to pay his debt?—Subscriber, San Jose.

A should bring suit against B alleging the time when he loaned him the money, that A has made demand and B has refused. The check and the letters, together with his testimony, would be sufficient proof to establish the claim. If B is in the east he can bring attachment against B's property and publish summons and get judgment in that way.

Partnership Pumping Plant

A and B are developing two twenty-acre tracts and to save expenses are dividing the cost of installing a pumping plant, building a reservoir and one line of cement pipe, from which both tracts will be irrigated. Each will contribute half of the land for the reservoir (about 50 feet each). The well, pump and pipe line will be on the property of A. What arrangement is necessary to guard the interest of both parties in case either should sell their property later?—Subscriber, Stockton.

The two parties should make a written agreement, each licensing the other for the use of the ground occupied by reservoir and pumping plant for such time as they may deem wise, which agreement should make provision for the repayment of money advanced by either in case of sale if such should be deemed best. Such agreement should be acknowledged before a notary and recorded.

Misrepresentations of Agent

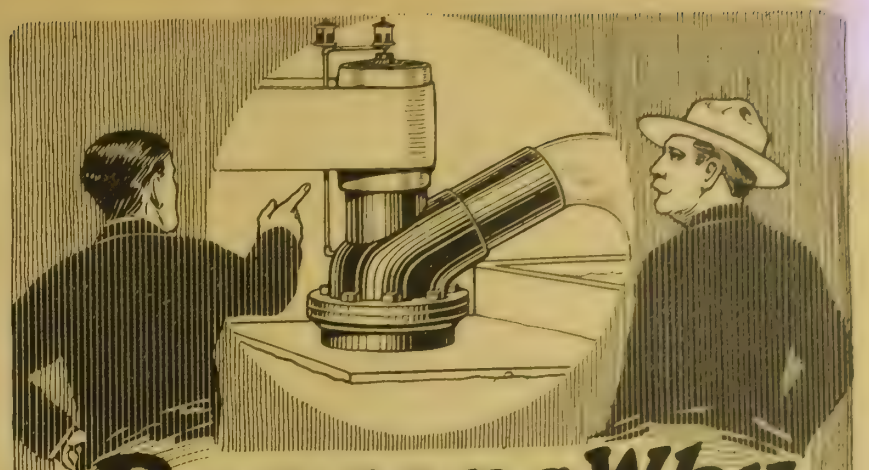
Can a real estate agent be held responsible for misrepresentations?—Subscriber, Soquel.

An agent may be held responsible for any misrepresentation of fact upon which the purchaser relied and by which he has been damaged.

Technical Trespass

A owns piece of land around one-half of lake; B owns land around other half. Can A stop B from going across his line if B stays on the water?—Subscriber, Elizabeth Lake.

It is presumed that each owns to the center of the lake, which it is presumed is not navigable. Such being the case B when he passes over the line commits a technical trespass upon the land of A, for which he could be held for nominal damages. The property of A not being fenced there would be no criminal liability. If B should do damage as a trespasser he could of course be held for such additional damage.



Reasons Why-

You Should Install the

Layne & Bowler Pump

THE ideal pump you want must meet the conditions of your well perfectly. It must develop water at the very lowest cost and with the absence of pump troubles. Furthermore, it must continue giving this high standard of service year in and year out. You cannot go amiss by installing the **Layne & Bowler Pump.** It has more than demonstrated its efficiency, durability and economy.

Prepare now for the irrigation season.
Write for our Free Catalog No. 30.

FEEDING LAYING HENS

Written for California Cultivator

By Jean A. Koethen

I HAVE been much interested this fall in watching the performance of four different pens of hens and pullets. Pen No. 1, which contains six yearling and two-year-old Orpington hens, is not laying at all. Pen No. 2, five yearling Buttercups (fall hatched), has averaged nearly two eggs a day right through the molt, which is very good laying indeed. Only one has seemed to become entirely dormant. Pen No. 3, six Buttercup pullets hatched in March, should, according to all the rules, have given the largest percentage of eggs, but they have not averaged over an egg a day. Pen No. 4, seven Orpington pullets hatched in March and the early part of April have been shelling out the eggs at the rate of two and three a day all the month and have now come up to four.

There is some excuse for the Orpington hens, for they each hatched a brood in the late spring and laid well through August and September, going into a late molt in October, but why should the Buttercup pullets on exactly the same ration fall so far behind the Buttercup hens and the Orpington pullets? There is but one answer, "breeding." They are all thrifty, well developed pullets raised like the Orpingtons on free range, well fed, with big, red combs, but they were bought as chicks from a breeder of whose stock I know nothing, and have apparently not been bred to lay.

The case of these pullets exactly bears out the statement of Prof. A. G. Phillips of Purdue university in Bulletin 10: "Profitable egg production depends on four things—inborn tendency to lay, good health and vigor, comfortable and congenial quarters, proper feed. Therefore while the feeding may be an important item in egg production, it alone cannot control the number of eggs that are desired." This conclusion is not new. The results of all scientific investigation show that breeding comes before feeding as a factor in egg production. We must first have the hen with "inborn tendency to lay" and then feed her the materials she needs for manufacturing eggs.

Proper Materials Required

"Eggs as purchased," according to Professor Jaffa's table in Bulletin 164, are composed as follows: Water 65.6 per cent, protein 11.8, per cent, ash .7 per cent, fat 10.8 per cent, shell 11.1 per cent. The materials we have to supply are, in addition to the shell material and the water, of which all hens require a liberal quantity, protein and fat. But the hen must also maintain her bodily heat and energy, and this requires a liberal supply of carbohydrates, i. e., starches and sugars, which make up the bulk of all grains. She also needs some protein for rebuilding the waste muscular tissue and green food of some sort to keep the digestive organs in condition. Green food also contains some mineral matter and alfalfa and clover are valuable for their protein content.

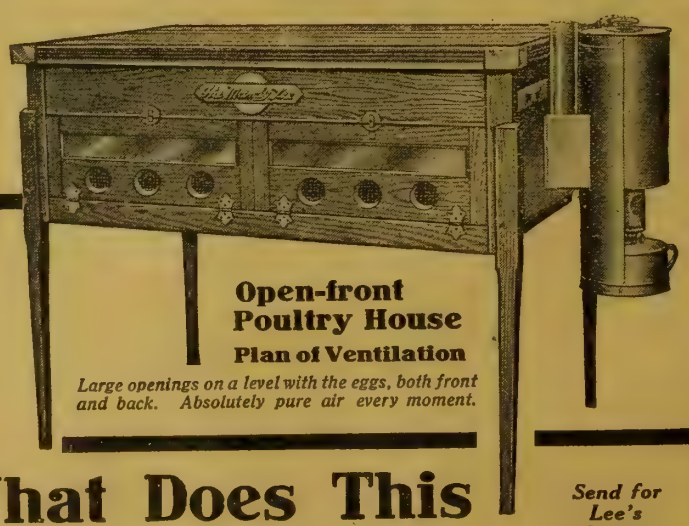
What shall we feed the laying hen in order to be sure that she has all the material she needs both for egg making and for maintaining bodily health? Grain to supply fats and carbohydrates, animal food in some form to supply the needed protein, and greens are the three kinds of food needed, or has been wittily said, "Grit (for grinding), grain, greens and grubs (meat), cover all her wants." This looks simple enough, and is really not as complex as some people try to make it.

Grain Feeds

First as to the grains. A ration of whole grain will not answer for it consists too largely of fats and carbohydrates; in other words, it is too fattening. Some provision must be made for supplying more protein and reducing the fats and carbohydrates, and this is best done by using the ground grain and mixing with it beef scrap, fish scrap, buttermilk or some other foodstuff such as soy bean meal or oil cake meal which have a very high protein content. The use of bran alone instead of wheat gives a higher proportion of protein than wheat supplies, for the nutritive ratio (proportion of digestible protein to digestible carbohydrates) of wheat is about 1:6, while the nutritive ratio of bran is about 1:3.4. Similarly, ground barley, which is now quite generally used in the dry mash in California, contains a higher per cent of digestible protein than rolled barley, the nutritive ratio of ground barley being 1:8.1, while that of rolled barley is 1:9.6. Wheat middlings contains less protein than bran but rather more than wheat, their nutritive ratio being 1:5.1.

The dry mash mixture which I have been using this fall with very satisfactory results consists of two parts (by measure) wheat bran; one part.

Mandy Lee
Incubator of Certainty

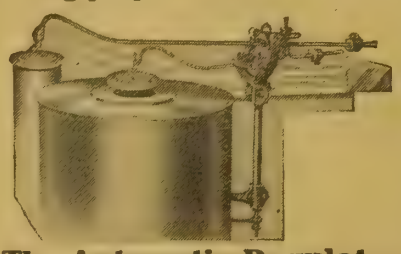


Open-front Poultry House
Plan of Ventilation

Large openings on a level with the eggs, both front and back. Absolutely pure air every moment.

Now, for the first time, Heat, Moisture and Fresh Air are measured and exactly adapted to each other.

A certain definite relation exists between these hatching requisites. Right proportions are vital to success. A wrong proportion spoils the hatch.



The Automatic Regulator

The Mandy Lee is the only incubator that recognizes and applies this vital incubating principle. The automatic regulator, the greatest feature ever placed on any incubator, regulates, adjusts, adapts and brings about right hatching conditions and *does it all automatically.*

What Does This Mean to You?

Send for Lee's Latest Free Book

Millions more chicks are going to be hatched from the same number of eggs. The new principle which is proving such a great success in the Mandy Lee Incubator is going to give the same certainty to all operators.

It makes an end to spoiled hatches, an end to experimenting and guesswork. Chicks come out well developed and strong instead of weaklings, because they have not been starved for lack of oxygen or shriveled up because of too little moisture. The Automatic Regulator takes care of *all* the conditions, and does it more exactly and correctly than you could possibly do if you watched the thermometer, the moisture pan and the ventilator every minute of the hatch.

SPECIAL PRICES on the Mandy Lee Incubators for a short while. Write for our prices and Catalague today, it's free.

PEERLESS POULTRY SUPPLY CO., 409 E. Third St., Los Angeles, Cal.

each of middlings, ground barley and alfalfa meal; about three-fourths part coarse beef scrap and one-half part fine bone meal. I use no corn meal for either Buttercups or Orpingtons except in the moist mash which I usually feed once a day. This moist mash is made of potato skins and table scraps cooked together with a little corn meal added. When it is taken from the stove it is thickened with the above mash mixture. If it contains scraps of meat or fish I thicken with bran and middlings only because the regular mash contains beef scrap and this is not needed. On fish day my fish man brings me the trimmings from the day before; heads, tails, etc. These I cook with my potato and tomato skins, remove as many of the bones as I can, and thicken. If I have lettuce I cut a head in after it has cooled. The hens like this and it gives the variety which is absolutely indispensable.

On the farms of the middle west corn was for many years the chief grain fed to chickens, and it is only of late that poultrymen have learned that this is a grain which must be fed with great discretion. It is still fed much more commonly in the east than in California, and with reason, for it is the most heating of all feeds, and fowls need it in the long, snowy eastern winters as they do not in our land of sunshine. The fat which corn contains becomes in Maine fuel for keeping the body warm; in California it is stowed away as surplus fat to the great detriment of the laying powers.

Fat is of some use to the laying hen. Not only is it needed as the nucleus of the egg when it begins to form, for the yolk is largely fat, but it helps to digest the protein in the ration. Feeds containing a great deal of protein such as beef scrap are rather hard to digest and there is in many of these feeds protein which cannot be assimilated. Investigations at the Massachusetts experiment station have shown that the more fat a ration contains the more easily is the protein digested. Corn when used with a good deal of beef scrap or other animal food may therefore become a very suitable article of diet for a laying hen. It is said that more corn is being used on the Pacific coast since wheat became so dear, and it may be poultrymen have found some way of combining it with a liberal quantity of meat so that the fat in the corn does no harm and the meat is more thoroughly digested. The matter is worthy of investigation at any rate.

In choosing the grains to feed price must always be considered. Wheat, which has a nutritive ratio of about 1:6 (different kinds of wheat vary in their composition), is the best all-round feed and can be used alone for a considerable time without detriment to egg production. One reason for this is that the hens do not tire of it as they do of barley and some other grains. Barley is an excellent feed of nearly as high protein content as wheat and is largely used in place of wheat since the price of wheat went up, but I have never found that hens like it as they do wheat. Even when it is sprouted they tire of it after a while. Some hens will eat dry rolled barley. I suppose mine would if they were compelled to eat it or go without, but they will not eat it if they can get anything else. Rolled barley, steamed with just a sufficient amount of water to soften and swell the grain without making it watery, is palatable and a very good growing feed, but my laying hens seem to prefer the whole barley sprouted. I soak the grain from 12 to 24 hours then pour it into a box with a crack in the bottom—a very small crack is sufficient—cover with a burlap sack and let it stand until the sprouts just begin to show. This is very palatable and more nourishing than grain that is fully sprouted. Sprouted barley for breakfast, with wheat and whole corn, or wheat and corn and barley for the evening meal, makes a very good balance when used with a good narrow mash ration.

The Balanced Ration

The balancing of the ration was a great stumbling block to me for a long time, and it was not till I came to realize that man may balance the ration as he likes, but the hen will dispose of it as she pleases, that light came. Theoretically here in California a ration which contains one part digestible protein to four and one-half or five of carbohydrates and fats is best; in other words because of the warm climate hens do best on what is called a "narrow" ration. Practically you give the hens a variety and they take what they choose. "First come, first served," I suppose. Yesterday I watched a little Buttercup pullet eating from a newly filled mash pan. She picked all over the top, carefully taking the beef scrap and nothing else. The next hen that came certainly got less beef scrap than that pullet did, whatever she may have preferred, and the last hen took what was left or went without. Doesn't this show the futility of worrying over the precise amount of fats and protein feeds to put in the mash? Doubtless the ideal method of feeding is to put the different feeds before the hens in separate hoppers, bran in one, beef scrap in another, middlings, barley meal, alfalfa meal and the vegetable protein feeds in others and the grains in others and let the hens balance to suit themselves. This is not as convenient as feeding all the ingredients in one hopper, but I believe we shall come to it in time.

When all is said, the heart and core of the balanced ration is variety. Hens must have a varity of feeds if only to keep up the appetite, and they must of course have all kinds of food which are needed, i. e., grains, greens and meat.

Animal Food a Necessity

Probably nothing is quite as necessary to the making of eggs as animal food in some shape, and in providing this we have the choice of meat or milk, whichever is most convenient. Green cut bone (scraps of fresh meat cut up fine, bones and all) is the best of all egg foods if it can be gotten fresh. This is the great difficulty. Cut bone that smells rotten and looks dark is not safe to my way of thinking, and hens that are accustomed to clean, wholesome food do not eat it with a relish though they may nibble at it.

Next to fresh meat the best animal food is milk. The poultryman who has skim or sour milk for his hens or can secure it at a reasonable price need not look for other animal food. The best way of using milk is to let it sour and then mix it with the mash. This mash moistened with sour milk is fed once a day at the egg laying contests at the Missouri experiment station with most gratifying results. When a well balanced mash is fed in this way the hens do not have a chance to pick out what they like best, and everyone gets her share of the milk, which is very high in nitrogenous content and very low in fat. Buttermilk, according to the table given in Farmers' Bulletin 22, is 91 per cent water. The other 9 per cent consists of protein 3 per cent, nitrogen-free extract (carbohydrates) 4.8 per cent, ash .7, and fat .5 per cent. Professor Jaffa's figures in Bulletin 164 differ slightly, the protein content being given as four per cent and the carbohydrates as 4.5 per cent. Probably California cows give richer milk than those in the east. At any rate it is plain that about half the available nourishment in buttermilk is protein. Best of all, this protein is all digestible, which is a very great advantage. Skim milk contains less protein than buttermilk, the per cent being about 3.3.

One great advantage in the use of milk, which these tables do not show, is its healthfulness. The acid in sour milk is believed to destroy the bacteria which breed in the intestines of fowls, so that diarrhoea and other digestive troubles are prevented. On the other hand the use of milk in any form is said to encourage the growth of intestinal worms, so that some breeders who use milk find it necessary to supply the birds with wood ashes to keep down the worms.

When neither milk nor fresh meat can be had the poultryman is obliged to fall back on commercial beef scrap and fish scrap, and these are, as a matter of fact, what nearly everyone uses to provide the necessary animal food. Beef scrap is not always fresh and wholesome. I am afraid that if

all were carefully tested much that is fed would be thrown away as unfit for food.

This is the test: Take a small quantity of the beef scrap in a cup and pour boiling water upon it. If the resulting broth smells like fresh beef steak the scrap is good; if it smells like fertilizer it is unfit for use. I have never tried this test; I didn't dare.

I have not the figures for the nutritive ratio of fish scrap, but it is nearly equal to beef scrap in protein content and perhaps a little more likely to be fresh and wholesome, but it is usually fed in connection with beef scrap. Some poultrymen feed them in turn in the mash, using fish scrap for a while, then beef scrap; others use both at once, making each about half the animal food required.

The necessity of meat in the ration is shown by a test at the West Virginia experiment station where one pen of fowls received a ration largely of corn and other starchy grains, while another pen was fed partly on meat and fresh bones. The meat-fed fowls laid 7,555 eggs, while the grain-fed birds laid 3,431, or less than half as many. The eggs from the meat-fed hens were larger, much firmer, rather better, and produced far more vigorous chicks than those of the others.

Storrs Egg-laying Ration

The ration fed at the North American egg-laying contest at Storrs, Connecticut, has been much commended. It is rather elaborate and contains more corn than it would be wise to use here, but it may be worth while repeating it to show what is considered an ideal ration. It is as follows:

Scratch feed: Cracked corn 60 pounds, whole oats 40 pounds, wheat 60 pounds, barley 20 pounds, Kaffir corn 10 pounds, buckwheat 10 pounds, coarse beef scrap 10 pounds.

Dry mash: Coarse bran 200 pounds, corn meal 100 pounds, gluten feed 100 pounds, ground oats 100 pounds, coarse middlings 75 pounds, low grade flour 25 pounds, fish scrap 30 pounds, beef scrap 30 pounds.

Gluten meal and low grade flour are feedstuffs which so far as I know are not milled on this coast. To supply the protein which they contain, soy bean meal or some of the other vegetable oil meals could be used, I presume. I have read that alfalfa meal was added to the mash this year.

Stimulants and condiments which are sold under the name "egg-maker" or "egg food" should be used with great caution, if at all. Some of them may seem to increase egg production for a time, but, as is the case with all stimulants, there is bound to be a reaction sooner or later, and sometimes they contain ingredients which are positively harmful. An exception may be made in the case of mustard bran, which, moderately used, increases production without harmful results. Many poultrymen speak highly of this stimulant, and it is in quite general use.

No Rule for Quantity

Regularity in feeding is nearly as important a factor as the feeding of the right feeds. Hens must be fed at regular hours; they must have clean, wholesome food and plenty of it if they are to do their best. There can be no fixed rule as to amount. Some hens eat more than others; a hen that is laying needs more food than one that is dormant; and some breeds are larger eaters than others. The good layer will be a good eater and she must have all she needs. It is customary to keep the dry mash before the hens so that each may help herself as she will and to feed the scratch grain in deep litter, giving a sufficient amount so that each hen may go to roost with her crop full. Just how much this is can soon be determined by watching the hens or feeling their crops. When my hens seem hungry half an hour after they have been fed I give them more grain. It is a good plan to keep a little grain in the litter so that the hens may always find it by scratching.

A Splendid Chicken and Fruit Ranch, improved, 80 acres, very cheap at $3000. Address owner, A. Frederikson, Santa Maria, Cal.

MISCELLANEOUS

St. Joseph's Agricultural Institute, Rutherford, Napa Co., Cal. An Agricultural High School for boarding students. A thorough training given in the theory and practice of diversified farming. The school is located on a thousand acre farm. The students assist in all the branches of work conducted on the farm, plowing, seeding, cultivating, orchard and vineyard work, dairying, hog raising, poultry raising, etc., thereby acquiring a practical knowledge of agriculture which is of equal importance to the theory. The Eighth grade is also conducted, as a preparatory class. The fee for board and tuition is very reasonable. Classes reopen on January 4th, 1915. For further information apply to the President, Bro. Thomas H. Claffy, S. M.

We are preparing to move from one of our warehouses to a new one, and find hundreds of items that we wish to close out quickly. Plows, Harrows, Land Rollers, Ridgers, Drills, Transplanters, Cultivators, Mowers, Rakes, Feed Cutters, Cream Separators, Milk Cans, Pails, Barn Equipment, Gas Engines, Scrapers, Vehicles, Wagons, Trucks, Garden Tools, etc. Prices sharply reduced. Write or call and see us. Newell Mathews Company, 200 N. Los Angeles St., Los Angeles.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

How to Make Money in California on an investment of $1,000.00 or less. I will tell you how to double your money yearly. Send 25c for book. Alfred Mitting, expert horticulturist, 8 New Street, Santa Cruz, Cal.

WANTED

Wanted — Responsible party to take charge of business in each county. New Automatic Combination Tool, combined wire fence stretcher, post puller, lifting jack, etc. Lifts or pulls three tons, weighs 24 pounds. Sells to farmers, shops, teamsters, etc. Descriptive catalogue and terms upon request. Harrah Manufacturing Co., Box M, Bloomfield, Ind.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property free. American Investment Association, 12 Palace building, Minneapolis, Minn.

Wanted—To hear from owner of good farm for sale. Send cash price and description. D. F. Bush, Minneapolis, Minn.

IMPLEMENTS

We are preparing to move from one of our warehouses to a new one, and find hundreds of items that we wish to close out quickly. Plows, Harrows, Land Rollers, Ridgers, Drills, Transplanters, Cultivators, Mowers, Rakes, Feed Cutters, Cream Separators, Barn Equipment, Gas Engines, Scrapers, Vehicles, Wagons, Trucks, Garden Tools, Milk Cans, Pails, etc. Prices sharply reduced. Write or call and see us. Newell Mathews Company, 200 N. Los Angeles St., Los Angeles.

SEEDS AND PLANTS

Sudan Grass—Pure, officially inspected, recleaned Sudan Grass Seed in seamless cotton bags, prepaid, 5-pound packages, $2.50; 10-pound, $4.50. Cash accompany order. Write us for prices on 100 pounds or more. Our prices are right. Dee Turner Pure Seed Company, Lubbock, Texas.

Strawberry Plants — Gold Dollar, Clark Seedlings, Magoons, Wm. Belt, Marshalls, Goodells, Early Ozark, and new Oregons, $2.50 per thousand. Thoroughbred plants. Mr. John Christiansen, R. F. D. 2, Canby, Oregon.

Sudan Grass—Government inspected, 50 cts. per lb. If you pay more you are throwing away your money. Amarillo Seed Co., Amarillo, Texas.

Berry Plants, Rhubarb, Cacti—It will be worth your while to send me a postal right now if you are interested. Louis F. Scribner, P. 2, Pasadena, Cal.

Sudan Grass, Kudzu, Imp. Alfalfa, Spineless Cactus—The big four forage plants. Prices O. K. Write, J. L. Lawson, San Jose, Cal.

Rhubarb—Crimson Winter, $3.00 per hundred; Wagner's Giant, $5.00 per hundred. Good, strong, one-year plants. Currier Bulb Co., Seabright, Cal.

For Sale—Avocado Seed, also fine budded "Taft" Avocado trees. C. P. Taft, Orange, Cal.

For Sale—Beldi Barley, clean for seed. H. Pile, Ramona, Cal.

Brandywine Strawberry Plants — Fine large plants. J. H. Shirk, Tulare, Cal.

Himalaya Berry Tips—$2.50 per 100; $15 per 1000. A Cooley, Sunnyvale, Cal.

RABBITS

For Sale—New Zealand Rabbits. "The best meat producers." A grand bunch of fine, red, half-grown youngsters, 1 buck and 3 does for $5.00. Also mature stock. Your chance to secure a start of this splendid strain at small cost. Shipped anywhere. Standard Rabbitry, Santa Ana, Cal.

New Zealand Reds—Scored and sold on merit. Investigate. Our Catalogue is free. Caldwell Bros., Los Angeles, Cal., Box 613.

HELP WANTED

Wanted—3 or 4 berry growers to come to SANTA CRUZ, CAL., to grow berry plants for us under contract for 5 years; will also buy all the fresh berries when we put up our new berry-drier in 1916. We will guarantee that you will double your money each year. We need 1,000,000 berry plants grown each season, and also use 100 tons of berries for our drier. Send for particulars to SANTA CRUZ BULB & PLANT CO., 8 NEW ST., SANTA CRUZ, CAL.

DOGS

For Sale—Airedales. If you want a companion for the children, a faithful friend, a guardian for the home or an unequaled hunter for game, big or little, get an Airedale Terrier. A. H. Brinton, Woodland, Cal.

GEESE

Thoroughbred Toulouse Geese—Large stock. One, two and three-year-old. Breeders for sale. $7.00 per pair, $10.00 per trio. Snapshot photo on request. A. E. Nelson, El Monte, Cal.

A SIMPLE THERMOMETER SHELTER FOR ORCHARD USE

(Continued from Page 3.)

cludes rising air currents and intercepts any radiations from the earth, while the latticed sides allow a free circulation of the air. The shelter must be located at least five feet above the ground. It has been found as a result of many experiments that the indication of the thermometer in such a shelter usually gives the real air temperature correct to within half a degree. It is most in error on still, clear, cold nights, and on still, hot, summer days. In both cases the indications of the sheltered thermometer are too conservative.

"66. Sling Thermometer—Another method of getting the real air temperature is by means of the sling thermometer, which was devised by Arago in 1830. Since a thermometer shelter is not portable, a sling thermometer is particularly advantageous for scientific expeditions and for those observations of air temperature which are not made constantly in the same place. The sling thermometer consists usually of two thermometers attached to a board, which is provided with a chain or string, so that it can be whirled rapidly. In some cases the bulbs of the thermometers are covered by wire netting in order to protect them from injury.

"Whirling the thermometer brings a much larger quantity of air in contact with the bulb, and the exchange of heat with the surrounding medium by means of conduction is thus emphasized. The underlying principle in the use of the instrument in getting real air temperature is to so emphasize conduction that the effect of the radiant energy received or emitted becomes negligible in comparison. Several minor errors are introduced by whirling the thermometer. The centrifugal force causes a slight lowering in the indication of the instrument, and the friction of the bulb with the air would raise the temperature slightly, but these small errors counterbalance each other for the most part. It is supposed that the sling thermometer will give the real air temperature accurately to within a half a degree Fahrenheit under almost all circumstances."

FEDERATED POULTRY ASSOCIATION

A meeting of poultrymen of California was recently held in San Francisco, at which time was organized the new federated poultry association. George H. Crowley was elected president and E. J. Talbot of the San Francisco Poultry Association was made secretary. The aim of the association is to give stronger backing to poultry people the state over, watching especially over legislation and preventing, if possible, adverse laws going into effect. The association will endeavor to create a better sentiment toward the poultry industry generally and to induce chambers of commerce, railways and other large forces of the state to give it more consideration.

Poultrymen feel that if the state can appropriate $100,000 to maintain a horticultural commission to advance the fruit interests of the state, with large amounts to dairying, viticulture and other branches, it should not neglect so completely as it has the poultry industry.

The headquarters of the association will be at the office of Mr. Crowley, 316 Underwood Building, San Francisco.

CALIFORNIA "BRANCH" AMERICAN POULTRY ASSOCIATION

The California Branch American Poultry Association, under the presidency of Lyman C. Byce of Petaluma, is a live wire. Secretary Kruckeberg is mailing statements of financial condition and transactions for the past year. Referring to the proceedings of the National, and also to the local situation, President Byce says in his annual:

"One or two things I am indeed glad to note, viz.: The adoption of a new constitution, broader and more comprehensive than the former one, by which the term "Branch" is eliminated and the organization of state or provincial associations is made possible.

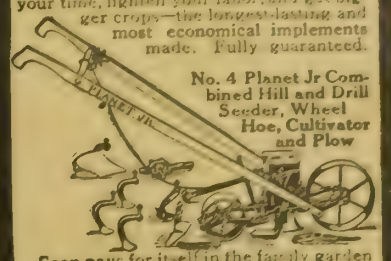
"The term "Branch" has always been distasteful to your president and secretary, and the latter had the courage to place on our stationery "American Poultry Association of California," and is entitled to all due credit for having done so. Your president was called upon at the convention at Atlantic City for an explanation of this deviation, and voiced his disapproval of the word "Branch" as being detrimental to the best interest of the institution in state work, and had the honor of being heartily commended by many of the most prominent members and received a great deal of favorable comment from leading poultry journals for his stand.

"It is a considerable source of satisfaction to know that the newly adopted constitution enables the members to drop the word "Branch" and adopt some other suitable appellation, and to California is the credit largely due."

From this it will be seen that the use of the word "Branch" in the heading of this article is not according to the constitution, and that from now on the state association will be known as the American Poultry Association of California.

Planet Jr.
Seeder-Cultivators

The farm and garden tools that save your time, lighten your labor, and get bigger crops—the longest-lasting and most economical implements made. Fully guaranteed.

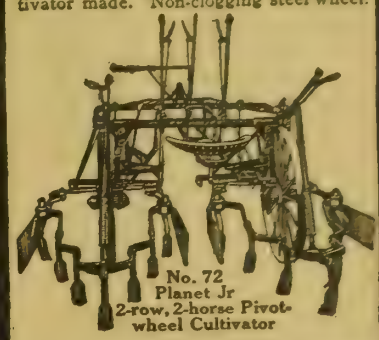


No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

Soon pays for itself in the family garden as well as in larger acreage. Sows all garden seeds (in drills or in hills), plows, opens furrows and covers them, hoes and cultivates quickly and easily.

No. 8 Planet Jr Horse Hoe and Cultivator

Stronger, better-made, and capable of a greater variety of work than any other cultivator made. Non-clogging steel wheel.



No. 72 Planet Jr 2-row, 2-horse Pivot-wheel Cultivator

Saves a man, a team and a cultivator every day it is used. Cultivates 2 rows of corn, potatoes, beans, etc., at one passage, even if rows are crooked or of irregular width. No wood used except for break pins.

72-page Catalog (168 illustrations) free

Describes 55 tools including Seeders, Wheel Hoes, Horse Hoes, Harrows, Orchard- and Beet-Cultivators. Write postal for it.

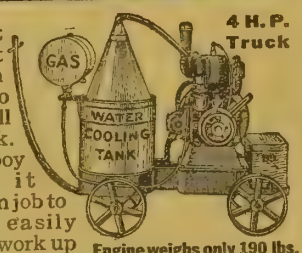
Light Weight Cushman Engines For All Farm Work



4 H. P. Truck

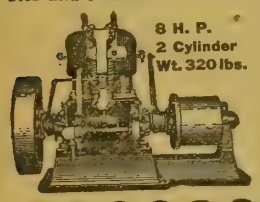
Engine weighs only 190 lbs.

This Light Weight Cushman Truck is so handy for all power work. So light a boy can pull it around from job to job, yet it easily handles all work up to 4 or 4½ H. P.

Runs at any speed desired, speed changed while running. Pump circulation to water tank prevents overheating, even on all-day run. All Cushman Engines are

Throttle Governed—Steady and Quiet

No jerky, explosive hit-and-miss running. They are the **most useful engines** for farm work, as they do everything the big fellows do and so many jobs big engines cannot do. May be attached to binders and other machines as power drive. Equipped with Schebler Carburetor and Friction Clutch Pulley. **Not a cheap engine**, but cheap in the long run. Sizes 4 to 20 H. P.



8 H. P. 2 Cylinder Wt. 320 lbs.

Engines Distributed from Pacific Coast centers. Write for free Engine Book.

Better Crops on Perfect Seed Beds

Prepared With the

ACME Pulverizing Harrow

AFTER-plowing sod or stubble it must be worked down thoroughly and pulverized. Sods, clods and lumps must be broken up; air spaces and voids worked out and filled to insure a seed bed that will give BETTER CROPS. Make available the plant food in plowed-in manure by thoroughly mixing with pulverized soil. BETTER CROPS will result.

The "ACME" Pulverizing Harrow

makes possible the *perfect seed bed*. Sizes 8 to 17½ ft. wide for one to four horses.

Light Draft—All Steel—Low Price

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bermuda Grass

What may I use to kill Bermuda grass or retard its growth in an open irrigation ditch? Hoeing out gives only temporary relief owing to the continual moisture in the ditch.—Subscriber, Anaheim.

To keep down Bermuda grass along ditch banks is a serious problem. Everything from goats and other live stock down the line to several kinds of chemicals have been tried and all have been found wanting to a degree at least. Keeping down the pest along ditch banks by pasturing with goats is perhaps the best method. Wherever possible to cultivate, a good team and sharp cultivator is most effective. Chemicals which will destroy this pest will also prove injurious to other crops growing on the same land or possibly to crops which may be irrigated with water from the ditch.

Grafting Almonds

Will you kindly tell me when is the best time to prune almond trees for grafting? Have six Nonpareils that have not borne and want to graft to some other variety. Would it be practicable to graft almonds on peach trees planted a year ago last spring?—Subscriber, Merced County.

Unless one is experienced in grafting stone fruits we would recommend resetting the young peach trees rather than grafting over. The making over of such an orchard is possible, but for the novice to attempt it would cost more and lead to less satisfactory results than to start in with clean grown, young, thrifty trees true to name. As to the larger almonds it is also a matter of experience and as a rule will not pay. However, we know some have succeeded in grafting over. This is the season for the work if subscriber wishes to try it.

Olive Cuttings

When is the best time to plant Manzanillo olive cuttings in the San Joaquin Valley? Should the ground be kept wet?—Subscriber, Terra Bella.

If truncheons or ripe wood cuttings are referred to plant any time for the next month or two. If it is intended to plant the herbaceous cuttings and they are going to be rooted in sand before being put into the open a few weeks later would be better. Roots of the olive require air, which cannot be secured if the soil is kept soaked. However, they do require sufficient moisture to keep them growing well the same as any other tree or, perhaps more correctly, the same as a garden crop.

Listing

I am planning to list my kafir corn, etc., next spring instead of plowing and planting with a drill as is usually done in this state. Will you or some of the Cultivator readers please tell me if it is safer to plant in that way. I would also like to know where I can get a lister and the proper size to buy.—Subscriber.

There is but little listing done in this state. Except where irrigation is possible it would probably not be best for the reason that the ground is not put in the best condition for holding moisture by this procedure. As to securing a lister, we think any implement dealer advertising in our columns can supply you.

Beans on the Desert

I have been told that in parts of Colorado and New Mexico Blackeye and Mexican Pink beans are grown profitably under desert conditions, with irrigation, yielding 15 to 30 sacks to the acre. By "desert conditions" I means no danger of frost from May 15 to September 15, with hot dry winds possibly after July 1st, very probably during August. The soil is a decomposed granite 6 to 12 inches deep, the subsoil a mixture of sand and red clay. There is no visible alkali but a probable deficiency in nitrogen. There are scanty native legumes. Cow pea plants grow thriftily and bear well, while others are lighter in color and less prolific. Evaporation is very rapid from June 15 to September 1. Last season Tepary beans planted May 5, yielded at rate of 800 pounds per acre. No previous experience in raising beans on desert but have grown on coast to some extent. Might do better with Teparies but there seems to be no demand for them. Whippoorwill peas planted June 24 for green manure matured some peas and were in full bloom when turned under late in September.—Subscriber, Lancaster.

In your section would suggest continuing the planting of the Tepary. It may not bear exceptionally heavy crops but it is certain and stands desert conditions. If other varieties of beans are planted and the hot dry winds should come at blossoming time the blossoms would all be blasted. The best proof, however, in this case is to try the Pinks and the Blackeyes, especially the latter, alongside the Teparies. One year's trial will give a very good idea as to how they will do under your conditions.

Renewing Orchard

I have an orchard of figs and peaches planted in 1912. The trees have made very little growth, less than two feet, having never been irrigated, but are of good color. If we are able to get water in a couple of years will they start to grow or will they be forever stunted? Will it pay to keep them?—Subscriber, Merced County.

We believe we would forsake the present plan and wait until water is secured and put in fresh young trees. It will be very difficult after trees have stood such a long period without thrifty growth to overcome the hard dry bark or hide-bound condition. This is one reason why good orchard trees should at all times have sufficent moisture to keep up growth until the regular dormant season in the fall. Ordinarily it does not pay

3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes, 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

to try to overcome the natural tendency of a stunted tree.

Horse Beans

How early can I safely plant horse beans in this locality?—Rancher, Merced County.

The horse bean is susceptible to frost, as are practically all members of the bean family, therefore your own neighbors, if you have no records, can best inform you as to safe period to plant. In some sections of the state this might be in March, but in most sections probably not until April or May.

Turnips for Humus

Would like to know the humus-making value of turnips. They bear an immense tonnage, and it seems to me they should prove of value to the land if grown and plowed under.—Subscriber, Orange County.

We have no very definite information as to the humus value of turnips, but since they contain a very high percentage of water the organic matter is low. Then, too, the crop is somewhat deceptive as to weight and a crop of 10 to 15 tons to the acre will be found oftener than a larger crop. Mangel beets will average 20 to 22 tons to the acre, and have a larger percentage of organic matter. Barley that is sowed early often produces a very heavy tonnage and much more humus than either turnips or beets, but the humus of neither is of as much value as that from vetches or some other leguminous crop. Vetch as grown in open ground will frequently produce a crop of 20 tons of green material to the acre though in some places it will not produce a paying crop and it then becomes necessary to plant a crop which will produce a larger tonnage. Plant vetch first, but sow early in October, so it can get a good start in the warm weather. If the vetch does not produce a good crop try barley for a few years and then vetch, but get humus in the soil however it is done. —J. B. Neff.

Pruning Roses

When is the best time to prune rose bushes? Should new growth be retained as much as possible?—Subscriber, San Fernando.

Now is a good time to prune roses, and if much new growth has been made do not cut too much of it away. Note that the old, mistletoe-like heads are not throwing out vigorous growth, therefore cut these away if strong canes below are putting forth strong laterals from vigorous buds. Thus will you get new heads in place of the old ones of many small and insufficient bushy twigs. Aim to cut away small and weakly wood, especially where there is manifest promise of its replacement by strong new growth. Never sacrifice really vigorous new growth for the reason that all such can, and probably will, produce a good crop of fine blossoms.—E. B.

Public Lands

Have read in your paper of homestead opportunities in Modoc and Siskiyou Counties. How can a man locate such lands?—Subscriber, East Bakersfield.

Write the United States Land Office at Susanville, California. In addition, we may suggest that anyone interested in public lands where the new settler may establish a homestead should write the Superintendent of Documents, Washington, D. C., for Price List 20, entitled "The Public Domain." This price list contains over 30 pages of titles of bulletins which may be had for a sum that covers merely the cost of publication. A great number of these pamphlets cost the applicant only 5 cents each and few cost more than $1. No money is required for postage, as government publications go free through the mails. Here are a few sample titles taken at random from the bulletin: Suggestions to Homesteaders and Persons Desiring to Make Homestead Entries, price 5 cents; Use of National Forests for Recreation Purposes, price 7 cents; Summer Homesteads on Public Land, price 7 cents; Homestead Entries by Minors, price 9 cents; Vacant Public Lands in the United States, price 5 cents. Other pamphlets listed will be of value to those interested in conservation and irrigation. There are also publications on boundaries, coal lands, desert lands, drainage, forest service, Indian lands, and lands in the various states, including the Philippines, Panama and Hawaii.

Breeding Sow and Cow

How soon should sow be bred after her first litter? Also how long should it take for her second litter?

Heifer will calve December 15. Would like the next calf to come in November. Will that be too soon?—Subscriber, Kerman.

Sows that are strong and vigorous should have two litters of pigs each year which divided evenly would be one each six months. The average period of gestation is 112 days. Young sows often farrow a few days earlier than that while mature sows may run over a few days. This period is approximately four months, and to have two litters annually the sow must be bred by the time her pigs are two months old. If one has skimmed milk to feed the pigs they may readily be weaned at the age of six weeks and the sow given time to recuperate.

November next will not be too soon for the heifer to calve again. The average period of gestation in cows is 280 days. This is approximately nine months and as the heifer will calve the middle of this month she will not need to be bred until February in order to have her calve in November.—L. A.

Fertilizers for Cantaloupes

What is the best commercial fertilizer to use with cantaloupes? Will early maturity be secured through the application of any fertilizer? The soil is rather heavy and contains a little alkali. On this land alfalfa has been growing for the past three years. —Subscriber, Imperial.

Fertilizers are applied to promote the growth of the plants and continued rapid growth is not conducive to early ripening of fruit. If alfalfa had sufficient time to decay the soil should be in excellent condition for cantaloupes as the soils of Imperial Valley are rich in all plant requirements except nitrogen, and the alfalfa should have supplied that. The time of ripening can be regulated by the supply of moisture better than by any other means. A smaller crop will be grown but it can be ripened earlier if the water is partly withheld after sufficient growth has been made.

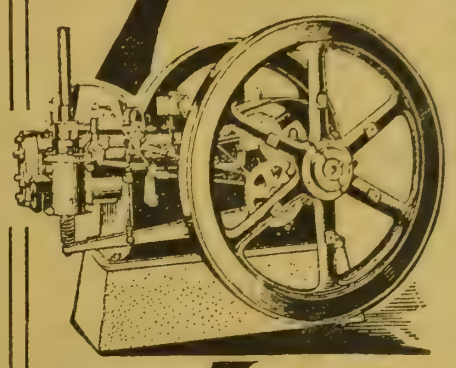
Bitter Cream

My cow was fresh in August and since bean harvest her ration has been bean straw with mash once a day composed of Proteina and wheat bran. The cream is bitter and it takes from six to eight hours to churn it into butter and when the butter comes it is so bitter that we can scarcely use it. We have fed bean straw before and never had this trouble. The milk is properly cared for. Can you tell us what is wrong?—Subscriber, Ventura.

It is not likely that the feed of the

STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅔c per gallon, cost one-third of a cent per HP. per hour to operate.



All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

cow is the source of the trouble. Bitter flavor in milk or cream is more often caused by bacterial action. The bacterium which causes this flavor thrives at a low temperature and thus bitterness may be present when the cream is not sour because souring is caused by a bacteria requiring a relatively high temperature. When cream is refined at as low a temperature as possible the bitter flavor occasionally appears because the particular bacterium enjoys the cold. No such flavor may be detected in the fresh milk but if the germ is there latent it may appear later in cheese or other products made from the milk.

In this instance the probabilities are that the bacteria causing bitter flavor are in the milk and thus go over into the cream. The weather is so cool that lactic acid (or souring) bacteria do not multiply rapidly and the bitter flavor grows apace. If lactic acid formation is begun early it seems to retard the growth of some other flavors such as bitter, etc. The suggestion in this case is to warm the cream (not above 70 degrees) as soon as skimmed so that it will begin to sour in a few hours. Then if churning is done only once or twice a week cool the cream immediately so that it will not become too sour. This starting of the lactic acid formation should retard or prevent bitterness. The fact that churning requires six to eight hours indicates that the cream is too cold. Use a thermometer and if a temperature of 62 degrees does not bring butter in 30 to 40 minutes try a few degrees higher. Put the cream near the stove or in a warm room where it will warm gradually as this is better than heating it quickly just before churning.

The best thing would be to eradicate the bacteria causing the bitterness. It is probable that the germs get into the milk at the time of milking. After grooming the cow, wipe the udder and flank with a damp cloth, in which case a minimum of dust will fall into the milk. Another precaution is to pour boiling water into the pails, pans and churn after they have been washed clean. Let the water stand in them a few minutes, preferably with the utensils covered, and no live bacteria will be left there.—L. A.

Pecans on Ditch

Will pecan trees grow in what is called slightly alkaline, or white alkali soil? How much irrigation do they require? Will they grow where the ground is kept wet, as for instance along an irrigation ditch that is used for watering more than half the days during the summer and for ten or fifteen days at a time? At what age do the trees begin to bear? What variety will do best on sandy-silt to sandy-adobe soil at an elevation of 2400 feet?—Subscriber, Lancaster.

We do not know how much alkali the pecan will stand, but we have seen some very fine trees growing near Lathrop, San Joaquin County, that showed a considerable alkali. The pecan will thrive under more water or irrigation than any other tree. The above conditions of irrigation would be ideal. Trees begin bearing a few nuts at from three to five years. Under all conditions the Stuart, Success, Delmas and Pabst seem to be the best we have seen tried out.—Claud D. Tribble.

I would not advise that pecan trees be planted in alkaline soil unless the alkali content is almost negligible. The pecan only succeeds well in a rich alluvial soil and in a warm climate. There are such conditions in parts of the San Joaquin and Sacramento valleys where this nut matures perfectly and bears well. They naturally need a great deal of moisture, but must have warmth, otherwise even if they set fruit they do not mature it. We would not recommend it at all for the elevation of 2400 feet. The trees begin to bear under suitable conditions at about the same age of the walnut. As to varieties, they have not been tested sufficiently long in California to determine their respective merits.—Leonard Coates.

FREE COURSE IN TRACTIONEERING

Jan. 18 to Feb. 13, 1915

Every owner of a Caterpillar, a Holt Gas Harvester, a Caterpillar Harvester, or a Holt Harvester Motor is invited to come himself or send his operator to a four weeks' free course in tractioneering to be held at Stockton between the above dates. Every man attending should plan to stay the entire four weeks, but those who come for only a week or two will be well repaid.

PROF. F. L. PETERSON,
Asst. Professor of Farm Mechanics, University of California,

leaves his position January 1, 1915, before continuing important work as Irrigation Engineer of the

U. S. Dept. of Agriculture,

will organize and conduct this course. Prof. Peterson handled the big tractor demonstration at Sacramento last May, has taught the scientific side of farm mechanics at Berkeley and practical tractor farming at Davis, and is the strongest man we could possibly secure. He will be assisted by our big service staff and outside lecturers, and will have the entire facilities of our big plant and laboratories at his disposal.

Lectures and Demonstrations.

The work will be divided into lectures, demonstrations and practical operation. Here are some of the subjects:

Electricity, Magnetism and Magnetos.
Carburetors and Carburetion.
Elements of Thermodynamics.
Lubrication and Lubricants.
Chemistry of Fuels.
Cooling and Radiation.
Business Management.
Scientific Irrigation.
Scientific Dry Farming.
Tillage Implements.
Uses for the Tractor.

Round Table Gatherings.

Several evenings a week Prof. Peterson will hold round table talks with groups of students on any subject connected with tractors or scientific farming, in which a considerable number may be interested. This chance to exchange experience with other top-notch men is alone worth all the time and expense of attending the course.

Practical Operation.

Rain or shine, you'll have plenty of practical work in handling the various Caterpillar models. We have arranged for plenty of room to work engines under cover if the weather is bad. This is the best way to put in your slack time and learn the latest kinks in operating.

Caterpillar Service.

This school is simply part of our plan to see that every Caterpillar owner gets the best results out of his investment. During the year we keep our service men constantly on the go, visiting every Caterpillar frequently, simply to assist the owner and operator in getting results. No other tractor concern in the world builds so nearly perfect a machine in the first place, nor takes such pains to see that it is kept in good shape afterward. This service and this free school are things you can't buy with any other tractor.

Tuition to Non-Owners.

While this school is for our customers first, we will admit a limited number of others at $25 for the full course only. This tuition will be refunded to any purchaser of a Caterpillar, Holt Gas Harvester, or Holt Motor before June 1, 1915. Application should be made at once and tuition must be paid in advance.

Board and Room, Etc.

We are making arrangements with the help of the Stockton Chamber of Commerce to list available board and room so all students can be made comfortable at the best possible rates. Write to-day for a folder of information and ask us to reserve a scholarship for you. Address

January Prize Photos

WE have often preached the doctrine of cleaning up back yards. The back yard which afforded the scene for the first prize winner this month is of the kind we would see near every farm home. To use an illustration which possibly may be worn out but expresses the situation so well that we use it once more, "Too many of our homes are built with Queen Anne fronts and Mary Ann backs." The family spends more of its time near the back door than it does at the front and for the sake of the family, members of which are securing their education at least in part from their daily environment, the environment should be made elevating so far as possible. It takes a little time to build rustic seats, to rake up the dead leaves and the rubbish and grow a lawn and keep it clipped, to plant a flower here and there, but the reward is so immediate—and the time may be secured if one wills it—that it should be encouraged on every ranch home. Perhaps we are not ready for it but we think that some time there should be a contest in which back yard photos are given exclusively. In addition to giving a lesson to all homemakers the photo which is the first prize winner this month is an excellent piece of work.

A COSY NOOK IN THE BACK YARD IS POSSIBLE IN EVERY HOME GROUND
First Prize Photo by Harvey Kishimura, Los Angeles.

We are not certain that the second prize winner is a front door scene for the little porch is a comfortable enough place for the homemaker herself to occupy for a moment's rest during a hard day's work. However, front or rear, it makes an attractive entrance to the home. This home is far more inviting because of its cluster of roses than would be a far more pretentious one without the roses, or at least without some attractive plant about the door.

The contest this month brought out

Next Contest

For best candy recipe, $2.00; second best, $1.00; for all published, six months' subscription to California Cultivator. Recipes should be in this office by Thursday morning, January 14.

Send Name of Subscriber

With recipes submitted send name of member of your family now subscribing in order that his or her subscription may be extended rather than adding an additional subscription.

EVEN THE HUMBLE COTTAGER MAY HAVE HIS ROSE-EMBOWERED VERANDA
Second Prize Photo by Milo Hunt, Whittier.

HOW TO HANG MIRRORS

Place one, after the French fashion, over the fireplace to reflect the room.

Place one, in English fashion, between the windows at the end of a long, narrow room, to emphasize the light there.

Place one where it will reflect a charming glimpse of the garden through a window opposite it.

Place one in the hall opposite the entrance into the drawing-room or the living-room to give a sense of spaciousness.

Place one on a dark wall, where it will catch the light.

Place one in a bedroom, where it will reflect the mirror of the dressing table.

Remember that flowers in front of a mirror are twice as attractive as flowers placed against a wall.

Remember that the ideal frame for a mirror is inconspicuous—as much as possible a part of the wall where it hangs.

THE OLD FABLE REVERSED

Managing the Business of 8,500,000 Telephones

Imagine a manufacturing business having millions of customers scattered over the country, with millions of accounts on its books, most of them less than $30 a year, and including a multitude of 5-cent charges.

Consider it as having shops and offices in thousands of cities, and reaching with its output 70,000 places, more than there are post offices in the United States. Think of the task of patroling 16,000,000 miles of connecting highways constantly in use.

This gives you a faint idea of the business of managing the Bell System.

Not all the 8,500,000 telephones are in use at once, but the management must have facilities always adequate to any demands for instant, direct communication.

In so vast an undertaking, every branch of the organization must work in harmony, guided by one policy. The entire plant must be managed in the light of accumulated experience, and with the most careful business judgment.

The aim of the Bell System is to make the telephone of the utmost usefulness. This requires an army of loyal men and women, inspired by a leadership having a high sense of its obligations to the public.

Animated by the spirit of service, and unhampered by red tape, the 150,000 Bell employes have the courage to do the right thing at the right time upon their own initiative. They work together intelligently as a business democracy to give the public good service.

The Household Department

IF WE HAD THE TIME

If I had the time to find a place
And sit me down full face to face
With my better self that cannot show
In my daily life that rushes so;
It might be then I would see my soul
Was stumbling still toward the shining goal;
I might be nerved by the thought sublime—
If I had the time!

If I had the time to let my heart
Speak out and take in my life a part,
To look about and to stretch a hand
To a comrade quartered in no-luck land;
Ah, God! If I might but just sit still
And hear the note of the whip-poor-will,
I think that my wish with God's would rhyme—
If I had the time!

If I had the time to learn from you
How much for comfort my word could do;
And I told you then of my sudden will
To kiss your feet when I did you ill;
If the tears aback of the coldness feigned
Could flow, and the wrong be quite explained—
Brothers, the souls of us all would chime,
If we had the time!

—By Richard Burton.

LEONE'S LESSON

LEONE walked slowly along the country road in the morning sunshine, and kicking the sand with lagging feet. She was a newcomer in the country school, and was miserably swinging her lunch pail disconsolately, homesick. She actually dreaded the very sight of the schoolhouse just around the corner, where she knew the girls were gathering on the playground for a merry chat before the bell should call them to study. It was almost time for it to ring now. Leone had lagged purposely, so that she might arrive as nearly on time as possible, without a moment to spare for greetings.

It was only a month since she had come into school, but it seemed like a year to Leone, who had never been among strangers before. If only she could have brought Frances, her dearest friend, with her, she felt that she could have faced this new world of strangers almost joyfully. But Frances had been left in the old home school with many other dear, familiar forms and faces. Leone's heart swelled with a fresh burst of homesickness as she came in sight of the schoolhouse and recalled the glad voices from that other playground so far away.

A Month is really a long time when one is nine years old and very lonely—plenty long enough for Leone to have formed many new and pleasant friendships had she not resolutely shut them away from her. Marie Stoner was also a stranger—having come into the school the week following Leone's advent—but she had already made a friend of nearly every girl there. As Leone came up the walk, she saw Marie, the center of a laughing group, including the teacher, and the sight not only intensified her loneliness, but added to it the bitterness of jealousy.

Miss Kennedy separated herself from the group and came to meet Leone. "We are planning for our picnic, Leone," she said. "You know this is to be a half-holiday, and we are to put all our lunches together and eat in the woods. You haven't forgotten, have you, dear?"

No, Leone hadn't forgotten; neither had mother when she packed the lunch. The tin pail was filled to the brim with good things. But Leone had fully decided not to join the merry company at lunch in the woods, although she said nothing of her determination to her mother. Now she turned an unresponsive face toward her teacher.

"I am not going to the picnic," she said coldly.

"Not going?" Miss Kennedy's voice expressed genuine surprise. "Why, my dear child, what is the matter?"

"Nothing, only I don't know the girls very well, and they don't seem to care a bit about me, and—" there was a spspicion of tears now in the rebellious voice—"I just don't want to go, that's all."

A look of pitiful understanding crept into Miss Kennedy's eyes. "I think you are mistaken about the girls not caring," she said kindly; "but how about yourself, dear? Do you care very much about the girls? It doesn't really matter half as much how people feel toward us, as how we feel toward them. It is the love in our own hearts that makes our sunshine, you know."

Without waiting for a reply, Miss Kennedy hurried into the schoolroom, and in another moment the bell summoned them all to study. Leone sat alone at her desk, feeling very friendless and far away from everybody. There was an aching sensation in her throat, and she could scarcely see the lesson on the page before her. Suddenly she felt a kind arm thrown across her shoulders, and her teacher said:

"Are you thinking of my question, Leone? Have you tried being kind and friendly to the girls?"

Leone turned a tearful face toward the kind one bending above her. "I don't care a straw for any girl in this whole world but Frances," she said fiercely, "and I don't want any of them to like me!"

"Hush, girlie! you don't mean that, I know." Miss Kennedy's voice was very tender and loving, for she understood that this was but an outburst of long-pent bitterness. She waited a moment in silence, and then continued in her usual cheery voice: "And now promise me, dear, that you will go to the picnic, won't you? You shall be my partner, and we will find just the right way to have a good time."

Leone reluctantly consented, and as Miss Kennedy turned away, looked up to meet the direct gaze of Marie Stoner. There was something so genuinely friendly in the look, that she unconsciously returned it in like manner. Just then the bell sounded for intermission, and the next moment Marie had Leone by the hand.

"You are going with us to the woods, aren't you, Leone? I saw Miss Kennedy talking to you, and I just knew you didn't want to go, and I knew why, too. You see, I felt the same way—

lonesome and strange and homesick, you know—until I got to liking the girls, and then it all left me."

Leone's eyes were wide with astonishment. "Why, I didn't think you ever felt that way," she said; "you didn't act as if you did."

"Didn't I? Well, it didn't last long; the girls were all so nice to me, and that makes it lots easier to forget. I know I am going to like this school just exactly as well as the one I left. Let's go out where the others are; they will be glad you are going."

Before the noon hour came, Leone found herself looking forward with joyful anticipation to the picnic; for, with her decision to go, all the bitterness seemed to drop out of her heart. It is needless to say the afternoon was a happy one, and long before the lengthening shadows drove them homeward—a laughing, tired crowd—Leone had learned the true way to win friends and be happy.—Girls' Companion.

IDEAS FOR THE COOK

Written for the California Cultivator By Isabel Cottle

Breakfast

Stewed Dried Plums
Country Sausage Fried Apples
Corn Muffins Coffee

Lunch or Supper

Clear Beef Broth
Scalloped Salmon and Spaghetti
Graham Nut Gems Preserved Apricots
Tea or Milk

Dinner

Savory Beef Roll Banana Croquettes
Special Baked Potatoes
Orange and Celery Salad
Maple Custard Pie Coffee

Savory Beef Roll

Select the piece of meat called the inside flank, wipe with a damp cloth, remove skin and fat and lay out flat on the bread board. Place in a mixing bowl a cup of grated bread crumbs, add one teaspoon of onion juice, one scant teaspoon of salt, one teaspoon of chopped celery tops, a sprinkling of paprika and a tablespoon of melted butter. Mix well and spread over the meat; roll up, tucking in the ends, and tie securely in shape. Slice into the bottom of a baking pan one white onion, two small carrots, a stalk of celery and a small turnip; place the meat upon the vegetables, lay on top three slices of bacon and pour into the pan two cups of soup stock, or hot water to which has been added a generous lump of butter. Cover closely and cook slowly for about four hours, basting frequently. When done season gravy and thicken with a tablespoon of flour rubbed into a lump of butter. Pour over the meat and garnish with crisp celery tops.

Banana Croquettes

Cut raw bananas into halves crosswise, dip in egg and crumbs, then in egg and crumbs again, and fry in deep fat. Serve hot with the meat.

Special Baked Potato

Wash potatoes and when thoroughly baked remove from oven and cut in halves lengthwise. Scrape out all of the potato (being careful not to break the skin), mash well and whip with salt and cream to make very white, light and smooth. Have one medium-sized onion chopped, ready to add to the potato. Whip together one minute and refill the skins, placing on top of each a slice of butter; sprinkle with pepper, place in hot oven and bake to a light golden brown on top.

Scalloped Salmon and Spaghetti

Break one-half cup spaghetti into short pieces, cover with boiling salted water and boil until tender, about 20 minutes. Free one can of salmon from skin and bones, place in layers in a baking dish, alternating with the spaghetti. Pour over all one cup thin white sauce made in the proportion of one tablespoon flour, two tablespoons butter, one cup milk. Season well with salt, pepper and one tablespoon lemon juice. Cover with buttered crumbs and bake 20 minutes in a moderate oven.

LACES IN THE LAUNDRY

Written for The California Cultivator By A. M. H.

Perhaps there never was a time when laces were so extensively worn as at the present. Every piece can be employed to good advantage, and both the black and white laces can easily be cleaned and freshened.

Rusty black lace may be restored by soaking for several hours in vinegar and water. The right proportions are two tablespoons of vinegar to a pint of water. When removed from this bath the lace should be rinsed in well-strained cold coffee. If any stiffening is desired, dip the lace in weak gum arabic water. The best way to dry a short piece of lace is to spread it smoothly over a large window pane while it is still damp, and when perfectly dry it will be crisp and new in appearance. The best way to wash a lace collar or any piece of lace that can be laid out flat is to baste it carefully to a piece of muslin larger than the collar and then baste another piece of muslin over the collar, as care must be taken to displace the threads as little as possible.

Fine white laces can be cleaned by washing in alcohol by using it as if it were water. Put the lace in the alcohol and allow it to soak for ten minutes, then wash by lifting up and down and pressing and squeezing between the hands and rinse in clear alcohol.

To clean white laces that are very soiled, cut up nice white soap and make a strong lather with hot soft water, then add a tablespoon each of ammonia and turpentine to two quarts of the suds, then drop in the laces and pound gently with a wooden potato masher and lift the lace up and down and pound until every part has been cleaned. When perfectly clean pour off the water and cover again with clear hot water. Pound well to remove the suds. Pour off, then dissolve a tablespoon of package borax in two quarts of hot water, pour over the laces and let stand for an hour, then rinse in clear water, and the laces will come out beautifully white.

To give them just the right degree of stiffness, dissolve a tablespoon of borax in a quart of water and use instead of starch. This also is the best way to stiffen fine lingerie blouses. They should be dried first then dipped in the borax water, wrung out, folded in a towel for a few hours and then ironed dry. There is nothing better than warm suds in which a little borax is dissolved for washing all the pretty crocheted laces so much used now, and for washing lace curtains of any quality, as the borax softens the water and this loosens all soil in the goods, and curtains should always be handled lengthwise instead of crosswise, to prevent breaking the threads.—A. M. H.

HE KNEW

Observing an unfamiliar shrub by a country roadside, a student of botany stopped to make an examination. "Are you acquainted with this flower, young man?" he asked of a passing yokel. "Yep," the boy laconically answered. "To what family do you think it belongs?" Indicating a near-by house with a pudgy thumb, the boy answered: "Higginses."—Puck.

Citrus Fruit Market

LOS ANGELES, Jan. 6, 1915.

The market has been cleaned up to a certain extent of the great mass of fruit caught in the blizzards all over the east. Much fruit in many of these cars has been so badly injured that a very heavy discount has been necessary. In some cars the lower tier has been frozen solid. The weather is now somewhat warmer and the fruit is being moved as fast as possible. North of Tehachapi total to date 5000 cars with perhaps not over 150 cars yet to go. The southern end of the state is anxious to enter into market with heavier shipments, but it is probable these will not begin to any extent before about the 15th. The season has been almost perfect for highest grade of fruit in the south as well as in the north.

The lemon market is slightly better with very light shipments.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914: 094 cars; lemons, 482; total, 1576. To same date last season: Oranges, 1150; lemons, 258; total, 1417. From Tulare County: Oranges, 4760; lemons, 82; total, 3842. To same date last season: Oranges, 3885; lemons, 19; total, 3904. From northern California counties: Oranges, 457 cars; last year same date, 348.

NEW YORK, Jan. 4.—Thirty cars navels, two cars lemons sold. Navels fully 25c lower; lemons slightly higher. Weather fair.

MOTOR CARS NEEDED FOR FARMS

Nearly one and a half million automobiles have been sold in the United States since 1902, when the business may be said really to have begun.

The number of these machines that have gone to the scrap heap is as yet negligible for commercial reckoning. The oldest is only 12 or 13 years old. You see the quaint old timers in service every day.

Next year, according to the forecast of the trade, nearly a half million more cars will be sold. These facts cause many to wonder where these hundreds of thousands of cars will go next year—and the years after that. They figure that there is now one automobile to each 70 or 80 people in the country. How many possible purchasers remain to be supplied?

Jasper, the well-known financial authority and writer for Leslie's Weekly, partly indicated the answer when he says, "Half of next year's output will be sold to farmers more largely for utility than for pleasure." The fact is, when the farm market is thoughtfully considered, it is found to be the dominant factor in the future of the automobile industry. And Jasper's words, "more largely for purposes of utility than for pleasure," furnish the reason.

Without taking into account the scrapping of old machines, which must be replaced with new ones, it may be said that stupendous as the business is, the possibilities have not been much more than "scratched."

Not quite 50 per cent of the automobiles in use now are owned by farmers. But there are in the United States, according to the census of 1910, 6,361,502 farms, with a total value of $40,991,449,090—an average value per farm of $6,444.

A supply averaging one automobile to a farm is a long way in the future—but the demand is not inconceivable. Some day, without doubt, it will be approximated—and when it comes it will represent a degree of progress and efficiency as far ahead of the present as the supply of that day will be ahead of the present supply.

Thus far the number of automobiles owned by farmers is only about 10 per cent of the total number of farms. The manufacturers would have to produce over five million more cars to fill the farm market alone.

The coming of the automobile has made remarkable changes in farm conditions. It is carrying the farmer far and wide over the countryside and bringing him into close touch with all the great improvements in agriculture.

Today it is no uncommon thing in any of the middle western states to see anywhere from 50 to 300 automobiles grouped about a field where a plowing contest is going on, or standing about the stable where there is a sale of fine cattle. These automobiles come from distances of 10, 20 and even 30 miles. They bring the farmer to these centers of interest quickly and without a great waste of time.

The automobile on the farm is a paying investment in many ways. On many farms the car does service both as a pleasure car and a truck. By removing the body the car is converted into a truck on which farm products are quickly taken to market at little expense.

In the old days, if a member of the family, or a valuable horse fell ill or was hurt, or a machine broke down in the midst of harvesting, the farmer had no choice but to take the consequences. He would drive off to town for help, but it was a long, slow drive over bad roads and help almost always arrived late. The car gives him the quick service he needs.

When it comes to the boys on the farm, no one can doubt the influence of the automobile in making the farm attractive. Both the boys and girls of the farm drive the car and take care of it, and you may be sure that the young men or women on the farm where there is an automobile see to it that the car is kept in good shape. There is a marked decrease in the desire on the part of the young to get away from the farm, and the automobile is one of the most important influences to bring about this change.

The automobile has promoted the good roads movement all through America. This is decreasing the cost of transportting agricultural products to market. And so important an item is this that it could almost be said that the improvements in roads alone would more than pay a big interest on the amount the farmer has invested in automobiles.

PARADISE OF THE PACIFIC

The Hawaiian Islands have adopted for themselves the name of Paradise of the Pacific and for those of us who are not fortunate enough to have verified the claim of the islands a fair idea of the correctness of the term is given by a magazine published in Honolulu under the title of the Paradise of the Pacific. It is a genuine wonder magazine every month, but the last number, that of December, was an annual which exceeds all others in beauty of workmanship and in views given of those beautiful islands. Many of the illustrations are three-color, and hundreds of others are excellent halftones. Perhaps the most striking of the illustrations are those of varieties of hibiscus growing on the islands, of which, by the way, there are more than 3000. These are accompanied by text by Mr. E. V. Wilcox, fully describing these plants. If our Hawaiian friends can get copies of this magazine into the hands of attendants at California's great expositions this year it will certainly give them a great desire for a visit to these beautiful islands.

A LONG WAYS FROM HOME

Last June a 540-Egg Pioneer Incubator was shipped to J. B. Merrett, Christchurch, New Zealand. Mr. Merrett is the owner and publisher of the New Zealand Poultry Journal.

A letter just received from him says: "We had a fine hatch, and the machine gives every satisfaction." We hope to get an order away to you at an early date.

A free 32-page catalog will be sent you if you mention this paper and address the Pioneer Hatchery, 112 East 8th St., Los Angeles, Cal.

1915 SEED CATALOG

Aggeler & Musser Seed Co., Los Angeles, is mailing its catalog. One of the first illustrations in the book gives the idea of the greatest plant on the Pacific Coast. Of course, the catalog is filled with descriptive matter and illustrations which may be of special value to the gardener.

The Fancher Creek Nursery's 60-page price catalog is certainly a classy publication. It is filled with illustrations and a world of information as to planting and care of plants and trees which are offered by these great nurseries. The Fancher Creek has been advertised and made known the world around, and has delivered goods in practically all parts of the world. If the Cultivator is mentioned we think this publication may be had for the asking. Write Fancher Creek Nurseries, Fresno.

Avocado Trees

Nursery stock grown under the most favorable conditions possible. Not the ordinary alligator pear trees raised under lath or in pots, but—

EVERYONE GUARANTEED TO BE VIGOROUS FIELD GROWN

I have made a special study of this new and promising fruit industry. Let me acquaint you with the wonderful possibilities.
Trees from 4 ft. to 7 ft. high, $2—$3.
Budwood—all standard varieties at reasonable prices.

The UNIVERSAL Motor Cultivator

For the Orchard —The Farm —The Vineyard —The Garden

The Only Tractor Suitable to Perfect Orchard Cultivation —A Power Plant for Your Stationary Work

TO THE Orchardist the Universal is almost indispensable. It will enable him to get the quick dust mulch, for the preservation of moisture, and stir the soil at low cost, to keep the weeds out. And besides all this, if the orchardist is also a farmer, the Universal will help him in a hundred ways.

IT CULTIVATES corn, cotton, potatoes, kaffir, sorghum, sugar cane, federita, tobacco, tomatoes, garden truck, orchards, vineyards, etc.

IT PULLS mower, rake, spike tooth harrow, drag, rollers, small disk harrow, cultivators of various kinds, weeders, etc.

IT PLANTS corn, cotton, sorghum, clover, alfalfa, potatoes, garden truck, etc.

IT OPERATES pump, wood saw, feed grinder, corn sheller, washing machine, churn, electric light plant, or any other light appliance of the modern farm.

Built for Hard, Practical Use in All Soils and under All Conditions

Toughest heat treated drop forgings of alloy steel. Steel and malleable iron castings. All crank and cam shaft bearings made of special bearing bronze. All working parts enclosed in oil-tight housings. All parts machined to the finest limits.

The "V" type, two cylinder, water cooled motor has 3½ in. bore and 5 in. stroke, automatic plunger pump lubrication, thermosiphon radiator, Holley carburetor, Atwater - Kent ignition, automatic governor, controlled from the seat while machine is in motion, worm drive running in oil bath, expanding ring clutch, one speed forward and reverse, gear ratio 55 to 1, weight 1,000 lbs., speed 1 to 4 miles per hour, motor develops 10 h. p. on break test, pulling horsepower equal to team medium sized horses.

Hitch to the Tools Now on Your Farm

Get This Book Let it tell you the complete story of this wonderful tool, the tests to which it has been put and its development into the modern, practical motor of the fields. When you consider that this tool costs you less than a good team and that it does more work, more hours for less money, you will want to read the full story. The book gives full specifications and much valuable information. Why not drop a card or a letter and get it at once, prepaid? Address

Vol. XLIV No. 2 LOS ANGELES: THURSDAY, JANUARY 14, 1915 One Dollar Yearly

Is There to be a State Agricultural Association?

Movement Launched at Recent State Fruit Growers Convention May Lead to Ambitious Organization Which Shall Represent All Phases of Agriculture, Economic, Cultural and Scientific. Committee Meets in Sacramento. Larger Meeting to be Held in San Francisco

CALIFORNIA has live stock breeders' associations, swine breeders' associations, draft horse breeders' associations, poultrymen's associations, bee keepers' associations, grape growers' associations, deciduous associations, citrus associations, nut associations, nurserymen's associations, with bean, alfalfa, date, cotton, cantaloupe and celery associations, a Protective League, Farmers' Union, granges and a dozen other associations, but no general fruit nor agricultural organized body to aid in advancing the larger interests of the producers of the state. For some months many fruit men of the state have felt that organization should be perfected. There have been annual or semiannual conventions called and financed by the state horticultural commission, and these will doubtless continue, but even then there is room for an effective organized working body.

At the 45th State Fruit Growers' convention held in Los Angeles the matter of such an organization which shall work for fruit growers' interests especially in working out plans for each meeting and in financing the publication of reports was presented. A committee was appointed which reported to that convention two plans.

First: The committee have considered the organization as at first proposed of a state horticultural society to be composed of all horticultural interests of the state with a corps of officers elected annually, and publishing annually a report of their proceedings financed by the dues of members. The committee believe this plan to be thoroughly practical and think that such an organization once started would attract a membership of from 2000 to 3000 people, which with annual dues of from $1 to $2 would furnish ample means for the publication of the report of the society. The committee are highly in favor of such an organization, if no better plan can be devised.

Second: The committee have considered a second plan which is more ambitious and appeals to them as preferable and as one likely to command the interests of the agriculturists of the state because of its broader conception and its greater ultimate usefulness in the development of the agricultural interests of the state. This second plan contemplates organizing in one great society all of the varied agricultural interests of the state, including horticulturists, agriculturists, stock raisers, dairymen and men engaged in scientific research related to agriculture. Such an organization would be comparable to the American association for the advancement of science.

The committee contemplates that such a general California agricultural society would have its corps of officers for the general association, and then would be composed of various sections representing the different horticultural and agricultural interests of the state, as for instance the following sections:

First. Citrus fruits.
Second. Deciduous fruits.
Third. Tropical fruits.
Fourth. Small fruit and bush fruits.
Fifth. Nursery interests.
Sixth. Dairy section.
Seventh. Live stock section.
Eighth. Grain section.
Ninth. Vegetable section, and such other sections as demanded by any special agricultural interests. If such an organization were formed the general association would probably hold a meeting biennially, at which business matters of general interest could be taken up, and the association in general be directed by its executive committee consisting of the officers of the various sections.

The different sectional meetings could be held as often as the various sections desire, and in places most convenient for the members of such sections.

The committee see many difficulties in the organization of such a general society, but believe that such difficulties can be overcome, and that a broad general agricultural organization of this sort would strengthen and cement the various agricultural interests of the state. They would recommend that a strong committee be appointed by this meeting for the careful consideration of these suggestions, and for the drafting of permanent plans, constitution and by-laws to be presented at the next meeting of this association for consideration and action.

The report embodying these two plans was unanimously adopted but the matter of accepting the definite plan and working out the scheme of organization was referred to a committee of seven of which State Horticultural Commissioner Cook should be one. Dr. Cook named the following as the other six of the committee: F. B. McKevitt of Sacramento County, Geo. H. Hecke, Yolo County; Dean H. E. Van Norman of the University Farm School, Senator B. F. Rush of Solano County; Dr. Herbert J. Weber of Riverside County and C. B. Messenger of Los Angeles County. This committee was called together at Sacramento last Thursday and the two plans discussed. Unfortunately Dr. Weber was unable to be present. He had suggested the larger of the two plans—the second given above. The committee decided that the more ambitious plan was the more worthy of the effort of Californians. This meant far more than a fruit growers' association and the committee which was appointed by a horticultural gathering felt that the next step would be the presentation of the matter to live stock and general farm interests before any definite report could be made to the State Fruit Growers' convention, to be held at Stanford University next July. It was decided to invite representatives of all farming interests to meet on the Panama-Pacific Exposition Grounds on Monday, February 22. That is Washington's birthday and the second day after the opening of the Exposition, so it is thought many representatives of state associations and many interested may be brought together at that time. The following statement and invitation is issued by the committee:

A proposed plan for a general agricultural society to include all branches of the industry, the purpose of which shall be to promote and protect the economic and other interests of the several branches of the industry, and which shall hold an annual convention including one or more sessions of general interest to all branches and sectional sessions devoted to farming interests. The recent successful campaign against the eight-hour law is an illustration of the need and power of united effort in behalf of the agricultural interests. Vital problems affecting all branches are before the industry and demand concerted consideration and active effort.

January, 1915. Secretary Live Stock Association. Dear Sir:—By direction of the recent State Fruit Growers' convention the undersigned committee was instructed to consider the feasibility of starting a movement looking to the organization of a state-wide agricultural association of some kind. We take the liberty of inviting your association to be represented by two or more persons at an informal conference to be held at the..... Building, Panama-Pacific International Exposition Grounds, San Francisco, February 22nd, at .....o'clock, to discuss the proposition. Enclosed is a tentative outline merely as a suggestion for discussion. Can we count upon your association's being represented with a view to reporting back to the association such suggestions as you may see fit to make after the conference? This meeting is a preliminary conference to discuss the feasibility, and, if approved, outline a plan of action. Yours truly, (Signed, members of committee.

Improvement of Fruits by Bud Selection

Address by L. B. Scott Before Kansas State Horticultural Society. Investigations Which Will Prove of Interest to All Fruit Growers

IT is needless to mention the Babcock test or to dwell on its importance to the dairy interests. Nor is it necessary here to discuss the value of careful seed selection in the improvement of corn and other grains. It is not so many years ago that men like Holden, Shamel and others were conducting their seed corn experiments and showing the results that could be accomplished by careful seed selection. This movement, like all pioneer movements, was at first ridiculed, but the investigators kept on, undaunted, and now those who a few years ago ridiculed the idea of careful seed selection are among its most enthusiastic advocates.

Turning to the field of vegetatively propagated plants, we see where marked improvements in yields and in improved types have been secured by a careful selection of cuttings or buds.

It was in the nineties that Dr. B. T. Galloway, now dean of the college of agriculture at Cornell, but formerly of the United States department of agriculture, and Mr. P. H. Dorsett of the department, found that by careful selection of cuttings from productive violet plants they could materially increase the number of flowers per plant. They kept performance records on each plant, counted the numbers of flowers, and by carefully selecting cuttings from those plants which produced the greatest number of flowers they were able to secure a very productive type of violet. Similar results

"Behind each tree is our guarantee"

Our name and guarantee stands back of every tree leaving our nursery. We specialize on foothill grown stock for hardiness, good, well branched roots, freedom from root knot and disease. They are superior to and unequalled by those grown in any other soil or location.

TRUE TO NAME

THE SILVA-BERGTHOLDT CO. CALIFORNIA FRUITS NEWCASTLE, CAL. TRADE MARK REGISTERED

REMEMBER

When you purchase **Silva-Bergtholdt Trees** you buy from a firm who are fruit growers and shippers as well as nurserymen.

Our buds are selected for propagating only from parent trees having the best record for quality of fruit and productiveness, thus insuring a pedigreed tree.

Our years of experience, knowledge and observation in horticulture are at your service. We show you how to succeed.

Write to-day for our Fall Catalogue

giving accurate description of each variety and valuable suggestions as to tree planting.

Order now while the assortment is still fairly complete.

The best varieties are selling rapidly. Don't wait too long.

ALMONDS

Plant Almond trees for profit. California has a monopoly of the American market, which demands four times the present supply. We have an extra fine lot of trees in all the standard varieties on Bitter Almond and Peach root.

WALNUTS

Mayette—The true Wiltz strain for productiveness, freedom from blight, and quality, has no equal in any of the other standard varieties.

Franquette — The true vrooman strain, next to the Wiltz Mayette. The best Walnut for Northern and Central California. Our scions of Mayette and Franquette are absolutely of true strain, cut from selected trees.

CLINGSTONE PEACHES

California Canned Clingstones have a monopoly of the markets of the world for the reason that Eastern grown Clingstones can be canned only for pie fruit.

Tuscan — Are our improved round Tuscan; firmer; more symmetrical; more productive; not subject to windfall and split-pit and preferred by all canners to the Oblong Tuscan commonly propagated.

Phillips—We cut our buds from a block of trees that have proven of an exceptionally good strain of this variety.

Levi—A fine late Cling and desired by many growers to prolong the canning season. Very productive.

Our trees received first prize and gold medal at the State Fair.

OLIVES

Our Mission Olives are worked on Picholine root. The Picholine is a stronger growing and a deeper feeding root system than one grown from cuttings. Plant Olives only on Picholine root.

PRUNES

Prunes are a staple money maker. Our parent trees of French, Imperial, Sugar and Robe de Sargeant have been selected for quality, productiveness, and size of fruit.

PEARS

The California Bartlett monopolizes the markets of this country and Europe. The opening of the Canal route reducing the cost of their transportation East and for Export by one-half, will create a demand for the California Bartlett and California grown Fall Pears that the present planting cannot supply. We have a fine block of Bartlett, Comice, Winter Nelis, Anjou, and other varieties. Buds are cut from selected parent trees.

CHERRIES

The first and best fruit of the summer season, grown only in California during their season of ripening and more profitable even than Oranges in Riverside County. Don't miss this fruit in your planting.

APRICOTS

Apricots being another fruit grown successfully only in California. Have a monopoly of the American market, and canned and dried the export demand is unlimited. We have a fine lot of trees in the standard varieties—Royal, Blenheim, Moorpark and Tilton on Peach and Apricot root. They are selling fast.

Write to-day for our catalogue, price list and full information about planting—it's free.

have been accomplished with roses, carnations, potatoes and many other vegetatively or bud propagated plants.

Why then when corn growers, tobacco growers, florists, vegetable men and many others are securing marked improvements in yields by selection should fruit growers work on the assumption that "all horticultural practices are based on the precedent of centuries" and that there can be no improvement of varieties by careful bud selection? Fortunately all fruit growers and all investigators did not work on that assumption. Within the last few years the department of agriculture has carried on a series of investigations with citrus and deciduous fruits to see if marked variations did not exist, and if by careful bud selection whether or not very productive types could be secured.

While we have published very little of our results to date in government publications, Prof. L. C. Corbett, in charge of all the horticultural and pomological investigations of the department of agriculture, has given us permission to appear at this meeting and in a general way give a summary of our results and outline methods whereby orchardists can study their individual tree differences and secure their own records.

Nearly seven years ago Mr. A. D. Shamel who had made an international reputation by his work in selecting productive types of corn, tobacco and cotton, went to California. He was assigned to the careful handling squad working under the direction of Mr. G. Harold Powell. His work took him all through the citrus groves in Southern California. Near San Diego he saw a very productive Marsh Seedless grapefruit grove which the owner claimed had been propagated from two very productive Marsh Seedless trees. Now this set Shamel thinking. He knew from his own experiences of the great increases in yields that had been secured in corn, tobacco and other crops by careful seed selection and he said to himself, "Why can not the same methods be applied to fruit trees by careful bud selection?" He talked the matter over with Mr. Powell and later with Dr. Galloway, at that time chief of the bureau of plant industry, and secured permission to commence the fruit improvement investigations.

The first investigation was commenced with Washington Navel oranges near Riverside. The writer became associated with this work in June, 1911. In July, 1913, our staff was further augmented by Mr. C. S. Pomeroy. In addition to the department men working on this problem, we are carrying on cooperative investigations with Prof. H. J. Eustace, head of the department of horticulture, Michigan agricultural college, Prof. A. V. Stubenrauch, head of the division of pomology, University of California, and a number of prominent fruit growers and nurserymen, both citrus and deciduous, in various parts of the country.

The principles we have found underlying this study are just as applicable to deciduous as to citrus conditions. After discussing the citrus investigations we will take up our deciduous work and lastly the methods whereby a fruit grower may find out for himself just what his individual trees are doing.

Citrus Investigations

We have, roughly speaking, under observation 1000 Washington Navel trees, 200 Valencia orange trees, 400 Eureka lemons, 200 Lisbon lemons and 100 Marsh Seedless grapefruit trees.

Our work naturally divides itself into three parts:

A study of the differences as they occur among individual trees under the same conditions. This includes a difference in type and a difference in production within each type.

Can these differences be propagated?

Will these differences be consistent from year to year in the budded trees?

Let us take up the first part of our work. Formerly a Washington Navel was thought to be a Washington Navel; a Baldwin apple, a Baldwin apple. We have found in the case of the Washington Navel that instead of one type there are 11 distinct types and these types are as distinct from each other as the white race is from the black. These types occur as tree sports, limbs sports and individual fruit sports. So far 11 types of Valencias, five of Eureka lemons, five of Lisbon lemons and five of Marsh seedless grapefruit have been found.

We wish to contrast for you two of the prominent Eureka lemon types. This will show better than any attempted definition of ours just what we mean by types.

First take the standard open Eureka lemon type of tree. Any time you look at that tree you can see fruit in all sizes from blossoms up to fruits ready to pick. That is just the condition you wish to have in a lemon tree, fruit coming on during each month in the year. A six-year-old tree of this type will bear from five to six packed boxes of fruit scattered throughout the year. The lemons from this type of tree grade as high as 95 per ent or higher first grade or fancy fruit.

Now right by the side of this tree is a dense, rank growing, unproductive "shade tree" type of Eureka lemon. All the fruit comes at one time in the fall, just the condition you do not want to have in a lemon tree. A six-year-old tree of this type will bear not more than one packed box of rough, poor quality fruit, and this fruit is all borne at one or two picks in the fall. The lemons from this type of tree grade as low as one per cent or lower first grade or fancy fruit, and practically all go with a third grade or culls.

Look at the difference! Both trees are healthy and vigorous; one produces five boxes of fine quality fruit in a year, the other, one box of poor almost worthless fruit.

We hope we have made ourselves clear on this matter of types. A variety is made up of a number of types, some worthy of propagation others not.

Now in addition to these variations in types there is a great individual tree variation within each type. Take two standard Washington Navel trees growing side by side. One produces ten boxes of oranges, the one next to it four. These differences are consistent from year to year. Both receive the same care, the same fertilizer, the same pruning, the same culture. No matter how much attention you give the four-box tree you can never bring it up to the standard of the ten-box tree. One is inherently a heavy producer, the other is not.

You will ask "How have you found out these variations?" They are not the result of "swivel chair observations." We pick each one of our trees separately, grading the fruit, coun

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913.

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas
California
U. S. A.

Teague trees are started right, grown right, and shipped right.

ing and weighing the fruit in each grade. These records are kept in special performance record blanks, following the tree through from year to year and keeping a yearly series record.

We will discuss the blanks more in detail when we take up the deciduous fruit work. We can turn to our notes and show you the actual amount of fruit, the numbers, weights and grades of fruit borne by each of our trees for the last five years. Our work is not based upon theory but upon actual observation in the groves and orchards.

Now we come to the second part of our work, the propagation of these differences. In the citrus work we only use or recommend for use for bud wood, fruit bearing wood with the fruit attached, because we believe the fruits on a limb can be taken as a guide as to what we can expect the buds from that limb to produce.

One or two examples will suffice to show these differences can be propagated.

One striking bud sport that we found was a limb on a standard Eureka lemon tree. This limb produces striped fruits and variegated foliage. Buds have been taken from this limb and show in the budded trees the same variation in fruits and foliage as the original limb.

Three years ago at Corona, the National Orange Company, on whose property some of our experimental work is located, decided to rebud 3000 of the unproductive or "shade tree" type of Eureka lemon out of their 200 acres of Eureka lemon trees. This is the type we referred to previously as being a shy bearer, bearing a few poor quality fruits in the fall. We selected the buds for this rebudding from as good productive type trees as we could find without having actual performance records to base our judgment on. Those trees came into bearing last year and every one of them were productive type trees. This year as three year old rebuds they are bearing four times as much fruit as they formerly bore as large unproductive trees. Just think what that means. In three years' time the worthless unproductive type has been replaced by a valuable productive type which bears four times as much fruit as it formerly bore.

Now take up the third part of our work. Are these differences consistent from year to year? We can show you whole groves in which the buds were selected from unproductive trees, and the budded trees have been consistently poor producers from year to year. We can show you other groves where the buds were taken from productive trees and these budded trees have been consistently high producers from year to year.

We have three and four year records on some of our own budded trees, and in every case differences in type and differences in production could be propagated and were consistent from year to year in the budded trees.

(To be continued next week.)

BY-PRODUCTS AT ORANGE SHOW

Special prominence will be given to citrus by-products at the National Orange Show to be held in San Bernardino February 17-24.

During the last year the manufacture of citrus by-products has been placed on a higher standard than before, but the industry has by no means reached the development that it will.

During the National Orange Show exhibits of by-products will be shown by manufacturers. In addition to the manufacturers, the citrus fruit growers have invited housewives to display their kitchen product from oranges and lemons and the domestic science classes of various educational institutions of the state will likewise display their work in citrus by-products.

Prizes are offered in all three branches of the by-products department.

In every manner possible the manufacture of citrus by-products is to be encouraged by the National Orange Show, at which many thousands of people will be shown how the orange and lemon can be made into various table desserts.

The citrus fruit men see a big field for manufacturers in the industry, and one that will become of importance to the state.

TREES

WE are digging our citrus stock now and the trees are splendid. We never handled or grew finer trees. They are of large caliper, well branched and absolutely free of all insect or fungus pests. We have about 75,000 trees to dispose of during the coming season which accounts for the low prices at which we are offering them: Oranges, Navel and Valencias; Lemons, Eureka; Grape Fruit; Limes. These are not "cheap" trees. They are first class in every particular but we are overstocked. The trees can be seen any time at our Nursery Salesyard back of the big store.

We also carry a full line of ornamentals, parking and street trees, roses and fruit trees. We invite your inspection.

Deciduous Fruits

PRUNE PLANTING IN CALIFORNIA

Written for California Cultivator
By a Sacramento Valley Contributor

"HOW many more prune trees can be planted in California without overdoing the prune business?" is a question that many prospective planters are asking.

Prune trees, especially on Myrobalan root, for planting on heavy land have found great favor during the past two or three years, and because of a shortage in the supply of Myrobalan seedlings from France, the principal source of supply, nurserymen have had difficulty in catching up with the demand.

The California French prune, well grown, on good land with an abundance of moisture for the maximum efficiency of the tree, is a product that ranks high among the fruits and foodstuffs of the world. It is a superior article of diet, and it has practically all of the world for a market, selling at a premium in competition with the home grown article.

Then there are many of the older orchards that are falling off in production, not because the trees have attained too great an age to bear if they had been given the right treatment, but because of one or a combination of things that could have been remedied. Lack of irrigation during dry years, with dieback of some limbs because of an effort on the part of the tree to protect itself against destruction by cutting off evaporation and the flow of some sap, or sunburn and consequent decay because of insufficient foliage on account of a limited water supply is one prominent reason.

Lack of fertility in old groves where big crops have been taken off for years without addition of plant food from barnyard manure, chemical or commercial fertilizers, or cover crops is another factor that is curtailing yields. And in other places where there may be plenty of fertility in the soil it has been made unavailable by a breaking down of the physical condition or mellowness of the soil by constant cultivation year after year with no addition of vegetable matter from any source. The humus has been gradually burned out, the soil grains run together, air and water penetrate less readily and the bacterial action by which plant food is rendered available for the rootlets of the tree is arrested to a greater or less degree.

Malnutrition, literally lack of food or moisture, makes opportunity for crops from new plantings, and the sapping of vitality from the tissues of the trees in old orchards by insect pests, far more.

There are many who are free to predict what they think the future may be as regards the planting of any crop. Right now people in position to be well informed say that we can never produce more high-class California French prunes than the world's markets can handle if they are properly distributed. And others are fearful that when the young trees now planted come in bearing prunes will be hard to dispose of at profitable prices.

As we see the situation one thing is certain, that prune growers in some of the older sections can make expenses, those who are planting trees on the rich irrigated or overflow lands of the Sacramento valley can grow the crop at a profit. If worst should come to worst, a three-ton or better crop will make a good return as hog feed, and the hogs will gather it themselves.

But a prophet of California futures in the fruit business is in a very bad business at best. Some of the things that seemed best to plant 15 or 20 years ago would not be used in a new planting today by the same people, and the fruit that by all the guessing and reasoning at this time appears to have a hopeful and profitable future may not prove out that way in 10 years more.

As an indication of the probable planting of French prunes this season one salesman of nursery stock in a Sacramento River locality is reported as having sold 18,000 trees before he began to solicit orders.

But to return again to the side of optimism. Our prune is a staple article of high-class food more and more appreciated by all classes of consumers, and when present day channels do not provide a profitable outlet for the crop, growers will unquestionably find other means of marketing and distribution that will be satisfactory. California fruit men have proven themselves very resourceful in emergencies, and can be depended upon to continue so to be.

IRRIGATED AND NON-IRRIGATED FRUITS

By J. S. Jones and C. W. Colver of the Idaho Agricultural Experiment Station.

It is a generally widespread belief that irrigated fruits are more liable to decay and possess less flavor than non-irigated fruits. Since this inferiority is attributed to abnormally high percentages of water and correspondingly low percentages of solid matter, analyses were made of the content of dry matter, sugar, acid and crude protein in various fruits grown under these two systems, with a view to testing the truth of these suppositions. It was not presumed, however, that chemical analyses alone could settle questions relating to quality in fruits.

The material used in these analyses was not obtained from specially controlled plots; all irrigated samples were grown in districts where climate and soil render irrigation imperative, all non-irrigated samples in districts where the annual rainfall varies from 25 to 35 inches and where the soil and topography of the country render irrigation methods impracticable. The comparisons are therefore made between normal irrigated and normal non-irrigated fruits.

In the case of drupaceous fruits analysis shows distinct differences in favor of non-irrigated fruits, especially when the results are calculated on the dry matter, but they are not considered sufficiently large to seriously affect the taste, except in the case of Italian and Petite prunes.

In the case of apples the non-irrigated almost invariably contain greater percentages of acid and sugar, but the differences are small and practically disappear when calculated on the total dry matter. Irrigated apples contain a smaller percentage of solids insoluble in water, but in intensity and uniformity of color, and in percentage of waste, they have somewhat the advantage over the non-irrigated.

Of the small fruits, strawberries alone show any marked difference in composition due to irrigation. When irrigated they are decidedly inferior in dry matter, sugar, acid and crude protein, and they lose their freshness and keeping qualities much earlier. In the case of blackberries and raspberries irrigation results in an increased percentage of sugar and a decreased percentage of acid when calculated on the total dry matter, and is therefore a distinct advantage in growing these fruits for marketing in the desiccated condition.

In general, it may be said that no marked differences in food and market value of fruits can be attributed to the effects of irrigation.

THE ROSY APPLE APHIS

Measured by its immediate effects the Rosy Apple Aphis (Aphis Sorbi) is the most dangerous of the plant lice. The unchecked presence of this species in the spring of the year results in a worthless crop of stunted and gnarled fruit at harvest time. This species is increasingly prevalent in the irrigated orchards of the Northwest, and already many millions of boxes of fruit have been destroyed through its working. Fortunate it is that control of the species is easy if undertaken in time.

Unlike the common but less dangerous Green Aphis of the apple, Aphis Sorbi neglects the new growth to work in and about the blossom clusters. The overwintering eggs hatch just as the buds are opening, about March 1, producing powdery, bluish-green lice. These aphids work down into the developing leaves, poisoning them and the future fruit, and later give birth to lice which finally become pinkish in color. In June blackish winged individuals appear, to fly from the apple trees which then are free of aphids until the return migration in the fall. In the meantime the poisoned apples grow but little, but ripen early as dwarfed, irregular, tasteless caricatures of fruit, hanging on the branches to testify to the destructiveness of the insect.

The customary sulphur-lime spraying as given in March fails to destroy both the eggs and the hatched young of this aphis. To become effective against plant lice this spray should contain tobacco, as in the form of Blackleaf 40, one part to 900. Recent experience in California warrants the recommendation of fall spraying with weak oil emulsions as the most dependable treatment. The winter eggs are not laid for several weeks after the fall migrants return to the apple trees and in the meantime the insects are susceptible to a weak spray and are easily reached. For such spraying a four per cent emulsion of crude oil, or a one to 1000 Blackleaf 40 spray would answer. In the latter case four pounds of soap should be added to every 100 gallons of the spray.—A. L. Melander, Entomologist, Washington State Experiment Station.

THE GRAPE LEAF HOPPER

By R. M. Roberts, Agricultural Demonstrator, Santa Fe System

The vine hopper is one of the most destructive insect pests that has to be dealt with in grape growing sections. It obtains its food by sucking the plant juices from the grape leaves which rapidly turn a pale yellow color and finally fall from the vine. Injury to the crop is two-fold. The absence of leaves prevents the vine from elaborating food with which to mature its fruit and also allows the sun to burn the berries. The fact that the vine is prevented from making its normal growth has a tendency to reduce the crop of the following year as well as that of the present year.

Control of this insect in the adult or winged stage as shown above is very difficult. They are immune to any spray as yet devised and their numbers in this form can be reduced only by the use of hopper cages. The over wintering brood can be reduced by cleaning up the vineyard before the

RUEHL - WHEELER NURSERY, San Jose, Calif.

oliage starts to grow, this operation utting off their food supply.

The eggs are laid on the under side f the leaf just beneath the epidermis, nd the young hoppers, or nymphs, fter hatching live and feed on the nder side of the same leaf. A period f 17 to 19 days elapses between the ime of hatching and the time the nsect attains wings and has ability o fly. During this period they go hrough five stages of development, ach denoted by a molting of the skin nd an additional growth of wing pads. Before attaining wings the nymphs re susceptible to liquid sprays of vari- us kinds, which kill by contact. The argest number are killed by spraying ust before the oldest are able to ly.

To effectively control these pests it s desirable to use a power sprayer with a pressure of 200 to 225 pounds. Two standard nozzles on the end of each spray rod add greatly to the effectiveness of the work which should be done largely from the under side.

After repeated trials with various nixtures the following has been found o be safe and satisfactory and at east 90 per cent efficient: Whale oil soap (bar or hard form), 5 pounds; black leaf 40, 1 pint; water, 200 gal- ons. Increase the soap 25 per cent where the soft or liquid form is used. The hard soap must be dissolved in hot water before being used. The per- centage of insects killed depends argely upon the thoroughness with which the work of spraying is per- ormed.

If it is desired to control mildew at he same time, atomic sulphur paste at the rate of 12 pounds to each 200 gallons of water or dry sulphur in the desired amount per acre can be added o the above mixture. It is important hat an agitator be used in this con- nection else the sulphur will settle to he bottom of the container. The cost of this work with a good power spray outfit should be about $2.50 to $3 per acre for material and $1.50 to $2 for abor.

DESTROYING SCALE WITH FUNGUS

The Los Angeles County Horticul- ural Commission is giving warning regarding use of so-called cures for black scale on oranges, olives, peppers and all other trees which harbor this pest. The material is sold either in liquid form, which is sprayed over the tree, or mixed with bread crumbs or similar material and attached to branches at various points in the tree. These "cultures" are supposed to spread the disease or fungus from scale to scale. The commission has thoroughly investigated results of the experiments and is sending out warn- ing that there is no value in the pro- cess, which appeals to many who are anxious to reduce cost of operating the orchard as low as possible. Fortunate- ly, the cost is very low, hence the direct financial loss is not great, but the injury to the orchard owing to false hopes may be serious. If one wishes to use such material he should experiment on trees which are entirely removed from the commercial orchard. There have been certain fun- gus enemies of insect pests which have been declared by the experiment station of Florida to do some material good in that state. This is especially true in the case of white fly, but we believe our experiment station or coun- ty horticultural commissioners have never reported favorably on any of these efforts in California. Of course, our climatic conditions are entirely different. Commissioner Wood is giv- ing warning: "In the future we shall give no consideration to the fact that this treatment has been used, but will require that groves needing treatment for scale infestation shall not be en- dangered by delay of the fumigation, and those which have this year been allowed to wait for a test of the fun- gus shall be treated just as if no treat- ment had been given."

Pears

Pronounced by Experts to be "Perfect in Appearance and Exceeding in Quality Anything in the Whole Country."

Read What this Satisfied user of

ROEDING TRUE TREES FRESNO, CAL.

says about Quality — and Service

Views in the Pear Orchard of Mr. B. M. DENISON, Tehachapi, Calif.

Tehachapi, Cal., Dec. 18, 1914.

Fancher Creek Nurseries Co., Fresno, California.

Gentlemen:

I want to give you a few particulars concerning the Bartlett pear trees which I purchased from you in the spring of 1909. My orchard of 40 acres has made a remarkably fine growth, and my place excites the admiration of everyone who sees it. When I planted this place, the people in this vicinity intimated that my undertaking was that of a tenderfoot and that it would be only a question of time, when I would find that I had made a great mistake in attempting to convert a locality that was only a sheep and cattle grazing country into a fruit district. Within two years after I had planted my orchard, it had made such a remarkable growth and the trees were so thrifty and free from disease, that it attracted widespread attention and caused prominent fruit growers from all over the Pacific Coast to make investments and immediately commence the development of their properties, so at this time, there are over two thousand acres planted to pears and apples.

I want to take this opportunity to express to you my appreciation of the advice given me by your Mr. George C. Roeding concerning pruning and general cultural directions. Although I gave the orchard the best of attention, I do not hesitate to say that the actual demonstrations which he made in pruning had much to do with the uniform, shapely appearance which the trees present today. My orchard is located on an elevated plain 4000 ft. above sea level where the climatic conditions are extremely favorable, causing the pears to open very late in the fall so that they keep in perfect condition for the holiday trade. Experts have pronounced these pears perfect in appearance and exceeding in quality anything which they have ever received from any other section of the country. I have planted several orchards since and I obtained these trees from you. These younger orchards are doing just as well as the first one I planted. I have simply had splendid success with your trees.

If you desire to use this letter in any way, you are at liberty to do so. Yours very truly,

(Signed) B. M. DENISON.

General Agriculture

MIXING CONCRETE ON THE FARM

ON account of its cheapness, uniformity, and quick development of strength, practically the only cement used at present is the kind called "Portland" There are almost as many brands of Portland cement as there are of wheat flour. For farm work choose some brand guaranteed by the local dealer to meet the standard specifications of the American Society for Testing Materials, which standards are approved by the national government.

Keep Cement Dry

Cement takes water so easily that care must be exercised in storing it. Upon the regular floor of a good building place timbers close together as a support for a false floor upon which the cement should be piled.

Cement is heavy; do not overload the floor of the building by piling it too high and do not store it against the side walls. Keep it covered with canvas or roofing paper. Cement once wet sets up and is unfit for use. However lumps due to pressure in the store house must not be mistaken for set-up cement. Such lumps are easily crumbled and may then be used.

Do Not Buy Stone Screened To One Size

Concrete is a mixture of Portland cement and particles of stone. The stone should vary in size from pieces one inch in diameter to sand grains. By so grading the stone the smaller particles fit in the spaces between the larger pieces, thereby producing the most compact and the strongest mixture.

The best stone for crushed rock is one which is clean, hard and breaks with sharp angles. Trap, granite and hard limestone are among the best; the use of shale, slate and soft limestones and sandstones should be avoided. The crushed rock should be screened on a one-fourth-inch screen to remove the fine particles. These small particles should be considered as sand; and if insufficient in quantity to make the proper proportion of the concrete as is described later, enough sand should be added to them to produce the required amount.

Well-Graded Gravel Good

Gravel well graded in sizes is at least equally as good for concrete as crushed stone. Bank-run gravel, just as dug from the pit, seldom runs even and rarely has the right proportion of sand and pebbles for making the best concrete. The mixture most suitable has one part sand to two parts gravel, measured by volume, in which all sizes passing through a one-inch mesh screen and retained on a one-fourth-inch screen are considered gravel. As there is usually too much sand for the gravel it is both advisable and profitable to screen the material and to remix them in the proper proportions. Gravel should have no rotten stone and should be clean so that the cement may adhere to it tightly.

Sand Must Be Clean

With dirty sand no amount of cement will make strong concrete. Generally sand is clean, but if not, it can easily be washed by playing a hose or flushing water upon thin layers of sand placed on a tight jointed inclined wooden board. In size of grain it should vary uniformly from fine to coarse. All particles passing a one-fourth-inch screen may be considered sand.

Any good tasting drinking water is suitable for concrete.

Tools

The tools and equipment necessary for making concrete in moderate quantities are already at hand on a well conducted farm or will be useful afterward for other purposes.

The list: two square pointed "paddy" shovels, No. 3, one round pointed tiling shovel or one garden spade, one heavy garden rake, one sprinkling can or bucket or one spray nozzle for hose, one water barrel or one length of hose, one sidewalk tamper or home-made wooden tamper, one sand screen made of a section of one-fourth-inch wire mesh nailed to a wooden frame, one measuring box or frame. See description further along in art-

cle, one mixing board, two wheelbarrows with steel trays.

Proper Proportions for Farm Work

For farm work the following proportions are most suitable: For concrete necessarily waterproof, 1:2:4 or 1:4; for all other ordinary purposes, 1:2½:5 or 1:5.

Such proportions of three parts, as 1:2:4, indicate that the concrete is to be mixed one part cement to two parts sand to four parts screened gravel or crushed rock; and 1:4 that it is to be mixed one part cement to four parts bank-run gravel.

Measurement by counting shovelfuls is poor and uncertain practice. To avoid splitting of bags of cement make as the unit of measurment one cubic foot, the amount of loose cement contained in one cement bag. Such measurements are made a very easy matter by gauging the wheelbarrows. For this purpose use a bottomless box holding one cubic foot. A shallow bottomless frame is also a convenient means of measuring. Such a frame, when set on the mixing board and filled, should contain the full amount of sand or one-half the quantity of gravel, or crushed rock, required for one batch of concrete.

Using a "Two-Men Board"

The size of the batch is dependent upon the amount of help and the dimensions of the mixing board or platform. For work of ordinary size sufficient room will be had on a "two-men board," 8 by 14 feet, framed solidly and covered with one-inch stuff with tight joints the short way of the board. A wooden strip nailed around the outer edges will prevent the loss of liquid cement. For such a board and the proportions designated above make the bottomless frame of the clear dimensions given in the table below.

Proportions:	Sacks of Cement	Framefuls of Sand	Framefuls of Crushed Rock or Screened Gravel	Clear Dimensions of Frame
1:2 :4 or 1:4	2	1*	2	0'6"x2'8"x3' 0"
1:2½:5 or 1:5*	2	1*	2	0'6"x2'6"x4' 0"

*For bank-run gravel use the same table, but no sand is required except that which is already in the gravel.

Labor-Saving Factors in Mixing

All the materials (slightly more than the computed quantities) should be on hand before beginning the work. They can often be hauled at odd times. The sand and gravel or stone should be piled so as to cause the least amount of wheeling, to make the mixing most convenient to the water supply, to allow room for the future location of the mixing board.

If the gravel does not need screening place a bottomless frame, previously described for a 1:4 mix, on the mixing board and fill it level full with gravel. Lift the frame, spread the gravel slightly with the garden rake and upon it distribute evenly two bags (the full amount) of cement. Set the frame upon the leveled surface of cement and gravel and again fill it in the same way.

Mix Carefully With a Rake

Remove the frame and spread the entire mass by dragging it back and forth with the rake. Two men opposite each other then turn the batch with the square pointed shovels. Again use the rake. Keep turning until the cement no longer shows in streaks, until the mixture has a uniform color. Throw up the ragged edges and with sprinkling can or hose with spray nozzle apply water in quantity, according to special directions given later for each particular kind of construction. Turn again and add as much water as may be required. If dry streaks are still evident continue the turning until they disappear. With wheelbarrows quickly remove the concrete and immediately use it in the work.

If crushed rock or screened gravel is to be used fill the bottomless frame with sand and distribute upon it two bags of cement. Drag the materials back and forth with the garden rake, then turn as described above until the mass has a uniform color. Spread the mixture so that two framefuls of crushed rock or screened gravel may be placed upon it. Wet the mass and turn as for bank-run gravel until each stone is coated with cement mortar. Remove as for the gravel concrete.

For the proportion of 1:2½:5 or 1:5 the method of mixing is the same.

Since crushed stone is more or less porous, in dry hot weather it is advisable to keep the stone pile wet or at least to water the stone well as it stands on wheelbarrows ready for the mixing board.

No vast amount of knowledge and experience is necessary to do first class work in concrete. Success is dependent upon the care and thoroughness exercised in the selection of the materials, mixing of these ingredients and protection of the freshly placed concrete.

VINE PRUNING IN CALIFORNIA

Bulletin 246 of the California agricultural experiment station, Vine Pruning in California, No. 2, by Frederic T. Bioletti will be in demand by every grape grower of California. It gives information as to pruning systems, ideals of pruning, handling vines before planting, first winter pruning and staking, second summer and winter pruning and, in fact, takes up in the most complete way of any work we have seen general outline of pruning operations. It has been some weeks since it was issued but we doubt not the experiment station still has copies for all vineyardists who are interested. Write to the experiment station at Berkeley.

THE GARDEN

Written for California Cultivator
By Ernest Braunton

EVERY garden owner may, if he wishes, have plenty of rich red berries on his own bushes at Christmas. He may even grow his own supply of mistletoe with but little effort.

Aside from the Heteromeles, or native berries locally called holly, there are a goodly number of shrubs which do well in this climate, that carry scarlet berries at yuletide. Nearly all of these find our summers too dry, and if such shrubs could be planted where the sun will not strike them during the hottest part of the day, fair success may be had with any of them. Under the shade of large trees is an ideal location, for in the shadow of buildings light and air is not as free and soils lack these neces saries also, as well as the atmosphere. Bacterial action is always deficient in the close shadows of buildings.

There are several species of cra taegus that are as well adapted to California conditions as any class of berry producers and grow in the open, under full sun, better than any similar plants except the native Christmas berry, holly, toyon or whatever popular name you choose for Heteromeles arbutifolia. English holly thrives splendidly when of some size, but small plants grow very slowly and fare poorly in California. Skimmia Japonica, Aucuba Japonica, Ardisia Crenulata, all need a mold-like loam of a free nature, and drainage must be good. All grow ideal berries. Our summer air is too dry for them and the more you can supply of moisture overhead during the hotter weather the better the results you will obtain. In the close damp shade on the north side of buildings it might be well to try the Partridge Berry popular in the East—Mitchella repens.

Now for mistletoes. The most showy one of native species is Phoradendron flavescens, which grows on cottonwoods and poplars. But a few miles from my home, up in the Arroyo Seco, they may be found on native trees and I have found them on the cottonwoods north of Sacramento and in all intervening sections. The mistletoe on the oaks is not so showy as the one parasitic on cottonwoods, though but slightly inferior and very closely related, being also a Phoradendron (P. villosum). The name is Greek—Phor, a thief; and dendron, tree. One could plant a cottonwood, slit the bark in numerous places, place a mistletoe berry beneath, tie a strip of cloth around the branch to keep birds from eating berries and doubtless grow all the mistletoes you care for. Or get berries from the other species and try on oaks, apples, and a host of trees quite common. In some parts of Europe, especially in England, the European mistletoe (Viscum album) spoils apple orchards and infests many native and introduced trees. In parts of California oaks often succumb to these vegetable parasites. In Amador County I estimated over 300 were growing on one large oak and the latter was decidedly on the wane. Two other species of mistletoe live on the pines and on cypress and juniper, respectively, the former (on pines) being leafless.

Planting Gladiolus

There is no better month than January for planting gladioli, and those who from year to year have watched them closely seem to agree in this particular. In light soils I would plant the bulbs down six inches and in the heaviest but three inches, varying the distance according to texture of soils.

Before planting, to prevent bulb rot, top rust, and to ward off diseases and insects, especially if bulbs are to be planted where gladiolus grew last year, I would dip the bulbs in the formaldehyde solution recommended for potato scab, one ounce of formalin to two gallons of water and allow them to stay long enough to be sure they are thoroughly wet through the loose skins that cover the bulb. Or one may soak two hours in Bordeaux mixture and allow to dry before planting. Even a dip in whitewash may benefit.

If found advisable to fertilize soil just before planting, dipping will certainly prove beneficial. Never use fresh stable manures of any kind when planting gladioli. If used at all, it should be so thoroughly rotted as to be black and mealy. Then use but little and thoroughly incorporate with soil. A better plan would be to mix well with top soil a commercial fertilizer containing about five per cent nitrogen, ten per cent phosphoric acid and ten per cent potash. Any fertilizer known to be good for potatoes or any underground crop will prove of great benefit to gladioli. But if used at time of planting we again caution you to mix it well with the soil.

Roses From Seeds

Ripe rose hips or apples are now plentiful and several readers have wanted to know how best to start the seeds. The first necessity is a stock of patience, for often all seeds in a mixed lot will not germinate for nearly a year. The effort to start them should not be given up before eight months have passed.

The seeds may be sown as soon as ripe though if in fresh pulp this should be washed away and seeds allowed to dry until they are fairly hard, for until a seed is cured "down" it is not ready to start "up." Sow seeds in a mixture of loam, leaf-mold, and sand and cover with a half-inch of the same material. After sowing keep cool and moist. The soil must never be allowed to dry, yet drainage must be good, so that if in boxes or pans see that holes are provided for the escape of surplus water. After seedlings have started your troubles are largely ended, for the young plants need no special treatment.

Keep Old Azaleas

Do not throw away potted azaleas when past flowering or even if they look sickly and lose their leaves. If you cannot plant them out in a cool place where they may be kept in a damp atmosphere during summer try and plunge them pot and all in the soil in a heavily shaded spot. Keep them growing until about October of this year at which time they should be in a slightly dormant condition

7% FARM MORTGAGES 7%
Safety First

$1000 Wanted for 3 years—7% semi-annually—20 acres in alfalfa, pumping plant and buildings alone worth over $1500—Conservative valuation $4000.

$2300 Wanted for 3 years at 7% semi-annually. 25 acres in alfalfa and 5 acres in orchard; pumping plant and good buildings; owned by German farmer—Conservative valuation $6250.

$3200 Wanted for 3 years at 7% semi-annually on 40 acres alfalfa; pumping plant; good improvements—Conservative valuation $7500.

SIERRA MADRE, CALIFORNIA

from a little studied neglect. Take out of pot, get rid of some of the outer soil on the ball, repot with new enriched soil of heavy texture and pot solidly. Use a blunt stick or cudgel to ram the earth down solid. Water well, keep top clean and as moist as possible and when new growth shows feed lightly but frequently with liquid manure.

Bluegrass or Clover?

The finest bluegrass lawns I have ever seen have been grown upon the heaviest black adobe, and while more work is required than upon lighter soils the recompense will come with a rank growth of dark-green grass with tall and wide blades so rank indeed as often to lead one to ask if it really is bluegrass. The poorest grass lawns I have seen were upon sandy soil even where very heavily manured, and on such soil I would much prefer to sow white clover as it will thrive on soils too light to grow good grass. The soil for clover should be inoculated with either a commercial dose of nitrifying bacteria or by a scattering over the surface of the still damp soil taken from a lawn of strong-growing clover. In the latter case wash it in before it dries out on surface.

Use Wood Ashes

Now that our German supply of potash is cut off by war in Europe it may be necessary for all to save closely wood ashes as a means of supplying potash to the soil. All brush, weeds, etc., can be burned in one place and the ashes joined with those from the house for use in garden and orchard. There are many planing mills where shavings and sawdust are used for fuel and ashes from these places may be available in sufficient quantities for top dressings for lawns, rosebeds and all flower and vegetable crops, for wood ashes may with profit be applied to all crops or mixed with composts or potting soil. The addition of bonemeal to the soil at the same time will furnish a fair balance of plant food for garden plants in general.

The Orange Trumpet Flower

Just at present all our people, and this most particularly includes visitors, are admiring the vines of Bignonia venusta, the Orange Trumpet flower from South America now blooming everywhere in semi-tropic California. But today I was admiring a large vine of it in Pasadena where it nearly covered one end of a house, and though I have known and handled this Bignonia for more than a quarter-century, I admire it more each year.

The Best Yellow Jasmine

For long years the only species of yellow jasmine we have had is Jasminum revolutum, but of late the new J. primulinum has become fairly common for it is as far ahead of the other as is the more common one superior to the deciduous J. nudum. Find a plant of the Primrose Jasmine in bloom and you will want one or more at once.

Preserve Native Growth

When clearing land for planting preserve all native trees and shrubs, at least temporarily, unless a change of surface or grade renders their preservation impossible or at least inadvisable. At San Diego I lately stood on a height where I could observe two slopes planted with material from the nursery. One had been cleared of everything before planting and the other had all the native shrubs left and the introductions were planted among them. The latter method is by far the best for so many good reasons that I will not waste time or space in enumeration or explanation. Merely clear away the weeds and herbaceous plants and leave all living hardwood.

Moving Native Oaks

It is not too late to move native oaks from the wilds and these as a rule do much better than nursery grown trees. Do the work at once. Dig holes first, real large holes. Take up the trees with all the roots you can get. Do it quickly and do not let the roots dry out while at work. In transporting them have wet straw or similar material in bottom of wagon, cover the roots with wet sacks, and as soon as soil is filled in about roots enough to hold tree in place, fill hole with water. Every tree so treated should live. They do for me and I have so moved trees at least a score of years old.

Small Fruits Vegetables

THIS MONTH IN THE SACRAMENTO VALLEY

Written for California Cultivator
By S. S. Rogers

THE most important work in the vegetable garden during the month of January is getting the land into shape for planting. As a general rule very little planting is done during this month for the weather is generally so cold that the plants will not start well and it has been found better to wait until it is milder.

Land which is to be used for spring planting should be heavily manured during this month at the rate of between 15 and 25 tons per acre. After receiving this treatment the land should be plowed as soon as possible to a depth of from 10 to 12 inches, leaving it in this condition until just a short time before planting. If the land is left in the roughened state it will hold the rains much better than if it is smoothed down.

During the latter part of this month in some localities the growers plant such crops as beets, turnips and carrots. It is recommended that enough of each of these vegetables be planted at this time to last through the summer. If these are planted during the latter part of this month they should be ready to harvest the last of April or May. At this season the prices paid for these vegetables are higher than later in the spring.

It has been found that lettuce will not do well in this valley in the hot summer months so that a planting of lettuce should be made within the next month or six weeks large enough to supply the demand up to the first of June. Seed for this crop can be planted during this month in the cold frame and the most popular variety is the Los Angeles. It is very important to get the land in good condition during this month for the February planting for during the next two months the bulk of the seed should be sown for spring and summer vegetables.

JAPANESE KUDZU VINE

The writer has had knowledge of this vine since 1876, when it was brought to Philadelphia by the Japanese as part of their collection of exhibits at the Centennial exposition held in that year. He secured a plant of it, and it is flourishing today, now over 30 years planted. There is a good deal of nonsense written about this vine, as is the case with many things. One writer quotes from another, knowing nothing at all of the subject written on. It is said of this vine that the Japanese do this, that and the other with it in the way of profit, which very likely they do, but the little profit that would satisfy a Japanese would not satisfy one of us, while there are so many other ways of making it. In the first place the kudzu vine is not an herbaceous perennial, as is generally stated. When young it dies to the ground in the fall, but as it gets older it does not, forming long, woody stems above ground, so that unless cut off clean to the ground every fall there would soon be a tangle of shoots above ground which would prevent its being mowed when grown for forage.

The vine is a rampant grower. The old vine the writer has makes shoots from the base 50-70 feet long in one season; in the height of summer it will make a foot a day. The leaves are in size and appearance not unlike those of the lima bean. Old vines let run up a tree bear flowers not unlike small bunches of wistaria, purplish pink in color, and slightly fragrant. The first white frost kills the leaves. The leaves when growing are on stalks which bring the top of the leaves almost a foot above ground. The vine does not bear seeds in this country, so that it has to be propagated in other ways. Nurserymen layer it, not finding it to root readily from cuttings, so to set out a field of it for forage small plants would have to be purchased. The best thing to do by those interested in this vine is to get a small plant from someone who advertises it, plant it in a good position and watch how it does. A season or two of experience with it would enable anyone to judge whether of any value or not in the way of forage.—Joseph Meehan in Practical Farmer.

He who uses pump and spray may have his fruit another day; he who will not spraying try will have no fruit unless he buy.—Rural New Yorker.

CITRUS Trees

Our stock comprises all the leading varieties of

ORANGES
LEMONS
POMELOS

Avocados, Limes, Etc.

Our stock is guaranteed true to name and is grown under ideal soil and climatic conditions.

DECIDUOUS FRUIT TREES

We also carry a complete stock of apples, pears, plums, peaches, prunes, grapes, etc., as well as ornamental and evergreen trees of every kind and description.

Economics on the Farm

WHAT IS THE FARMER'S REAL INCOME?

EXTENSIVE investigations into the profits of farming have indicated that the amount of money which the average farmer receives for his year's work is little more than that which he would be paid if he hired himself as a farm hand to one of his neighbors. In other words, though the farmer is in business for himself the average farmer gets little or no money reward for the intelligence and skill with which he has managed his affairs or the risk and responsibility he has assumed. But he must get something in return or no one would trouble to farm for himself. A recent study conducted by experts in the United States department of agriculture shows that in many cases this reward may best be found in the products with which his farm furnishes him directly. When a farm is nearly, if not quite, self-sustaining, say agricultural experts, where it supplies the family that lives upon it with most of the necessities of life, a large money income is not necessary to prosperity. A greater sum derived from a farm which yields nothing for home consumption may leave the occupants much worse off.

Under the title, "What the Farm Contributes Directly to the Farmer's Living" (Farmers' Bulletin 635) the department of agriculture is about to publish the results of a survey of conditions on a large number of farms in the 10 states of North Carolina, Georgia, Texas, Kansas, Iowa, Wisconsin, Ohio, Pennsylvania, New York and Vermont. The farms selected for study, though possibly a little more prosperous than the average, were fairly representative of their sections, which it will be noted include three corn and cotton areas, two states in the corn and wheat belt, two regions where general farming was carried on and three different dairy districts. The average value of the chief necessities of life—food, fuel, oil and shelter—used each year by the farm family, the investigators found to be $595.08. Of these necessities, estimated in money, the portion contributed directly by the farm was $421.17, leaving $173.91 to be purchased with the cash obtained from the sale of products. In considering these figures it must be remembered that if the farmer had been compelled to pay city prices for his home-grown necessities this $421.17 would have represented much less comfort.

Of the food consumed 63 per cent was furnished by the farm. This proportion varied greatly in the different sections but was greatest in the locality studied in North Carolina, where the farms supplied 82.3 per cent of the food consumed while the average in the New York locality was only 50.4. In view of the present economic crisis in the south this fact is regarded as of particular significance since it demonstrates the extent to which, with a proper system of agriculture, southern farms can be made self-sustaining. Concentration upon one cash crop, cotton, has proved disastrous, and agricultural authorities are now trying in every way to induce the people to adopt a system which will lead to conditions similar to those now prevailing in this particular area of North Carolina.

In this connection the investigation revealed some interesting facts in regard to the four items of groceries, animal products, fruits and vegetables in the average farm family's food bill. Of the value of the food consumed groceries constituted practically one-quarter, animal products more than one-half, vegetables 11.6 per cent and fruit only 6.3. Practically all of the groceries were bought; on the other hand, the quantity of fruits and vegetables used was in direct proportion to the quantity raised on the farm, and where this quantity was great the grocery bill was correspondingly low. This was also found to be true of animal products, including of course not only butcher's meat, but poultry, eggs, milk, cheese, etc. Where these were abundant on the farm fewer groceries were purchased. Since the grocery bill was found to be ordinarily two-thirds of the entire amount expended in cash for food, one very obvious and effective way of economizing appears to be to raise more vegetables, more fruit, more milk and eggs. In many cases, experts say, this can be done with no appreciable increase in trouble or expense.

Next to food shelter is probably the most important necessity of life. In considering the farmer's income, however, a common error in the past has been to ignore the question of house rent. The value of the house has usually been included in the value of the land and the whole considered as capital invested on which interest must be paid before the farmer can be regarded as receiving any pay at all. This method, however, assumes that the farm family is to have shelter for nothing, an assumption which the city worker with whom it is not unusual to pay out from one-third to one-quarter of his entire wages for rent alone would regard as most astonishing.

According to the recent investigation, if the average farmer had to pay rent, his home would cost him $125 a year. This figure represents ten per cent of the value of the average house. Including interest, depreciation and repairs, this is regarded as a fair rental charge for the class of houses usually found on the farm.

With the information at their command the investigators were also in a position to compute the average cost of board and lodging on the farm. In this they included an item very easily forgotten—the value of the housework performed by members of the family. This was reckoned on the basis of the wages that would have had to be paid for hired assistance. Including this with the more obvious charges for food, fuel, light and rent, it was found that board and lodging

Wilson's Quality Trees

Are in heavy demand this season. The selection of buds from established bearing orchards, careful selection of seed, causing healthy, vigorous growth—THE REASON. The following letter is one out of many thousands we have received in the past:

Grass Valley, Calif., Dec. 7th, 1914.

Fresno Nursery Co., Inc., Fresno, Calif.

Dear Sirs: In January, 1912, I received from your nursery 210 walnut trees of three varieties, which I am pleased to say have yielded since the first year of planting, each variety bearing a few nuts of excellent quality and TRUE-TO-NAME. I never lost one single tree of your shipment. The 600 pear trees received at the same time as the walnuts are also very satisfactory. My trees have done so well that the local paper has given considerable space about the vigorous growth of my orchard.

Very truly, (Signed) GORDON S. MORGAN.

That tells the story.—Prospective Planters, give us an opportunity of starting you right by supplying strictly first class nursery stock. Send us a list of your requirements for quotations. Our large 52 Page Book describes all varieties of Fruit Trees, Grape Vines, Ornamental Trees and Shrubs, Palms, Roses, etc. We send this book free upon request. Remember we specialize on **DECIDUOUS FRUIT TREES, CITRUS TREES, OLIVE TREES, FIG TREES, GRAPE VINES, and Hardy Ornamentals.** Write us if you want the best that money will buy. Address

THE FRESNO NURSERY CO., Inc. **300-340 Cherry Ave, Fresno, Cal.**

Kirkman Nurseries

RELIABLE TREES AND VINES

We again solicit the fruit tree and vine orders of the planters of the West, knowing that nothing but the **Best** will satisfy the experienced buyer. Twenty-eight years of successful nursery business has proven the quality of

KIRKMAN TREES

and the treatment Kirkman accords his customers. Our steadily growing patronage has demanded that we grow more stock each year, until we now have more than **five million** trees and vines growing in our nursery plants in California and Arizona. A considerable portion of the stock in our nurseries, which will be ready for delivery this coming winter and spring, is already sold to early customers, but we still have a complete stock of all varieties of fruit trees and vines, as well as a general assortment of **ORNAMENTAL** and **SHADE** trees, etc., etc. What are you going to plant? We have it, without doubt, in large or small quantities. Illustrated price catalog on application. Please mention what varieties you are expecting to use.

KIRKMAN NURSERIES **2525 Tulare Street, Fresno, Cal.**

for each individual averaged $14.62 a month. But of this sum it is interesting to note that the farmer paid out in cash only 22 per cent. Exclusive of lodging the board of the average hired man cost $10 a month, but here again the farmer had only to pay $3. The remaining $7 was furnished by the farm as a result presumably of the hired man's own efforts.

The averages obtained as the result of this investigaton are not of course to be taken as mathematically exact for the entire country. In the opinion of agricultural experts, however, they point with convincing emphasis to the possibilities of comfort and prosperity that may be realized by a fuller utilization of all the farm's resources. Cash crops are not the sole, and on the average they are not even the chief, source of real income. It is really what the farm furnishes directly to the farmer that enables him to support his family. To increase the quantity and quality of this direct supply is one great object of farm management studies.

AN EDUCATIONAL MEASURE

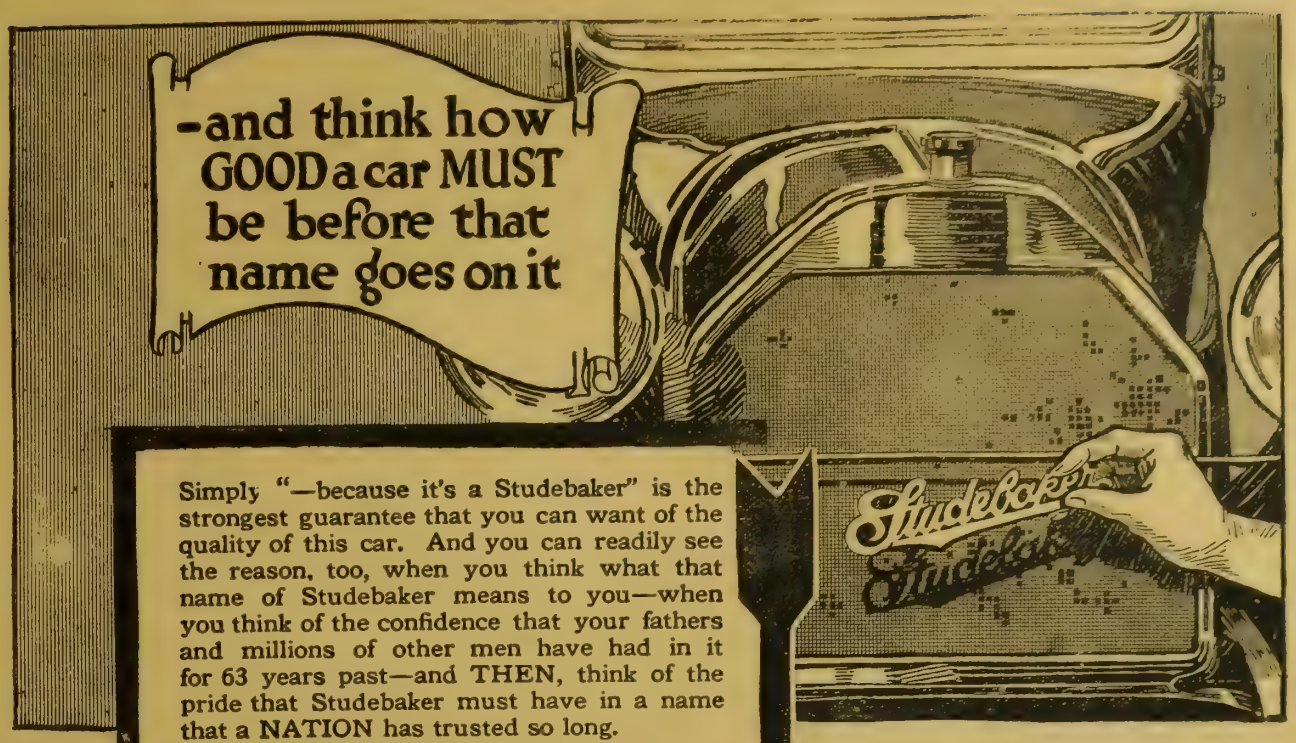
Many letters are being received by the United States department of agriculture which indicate that farm women in various sections of the country have come to believe that the government is about to assist them with grants of money to individuals. This unfortunate mistake, which, it is feared, will be the cause of considerable disappointment, appears to have arisen through a misunderstanding of the Smith-Lever act recently passed by congress. Under this act funds contributed both by the federal and state governments are made available for practical demonstration work in agriculture and home economics. Experts from the agricultural colleges and county agents, both men and women, are to show farmers and farm women the value of modern methods in agriculture and housekeeping and demonstrate the use of labor-saving devices. The purposes of the act are thus entirely educational and there are no provisions whatever for direct financial assistance.

This demonstration work which the Smith-Lever act is designed to promote has already met with considerable success in the states where it has been started, but the additional funds now available will greatly increase its efficiency. To avail themselves to the full of its possibilities the department officials recommend that farm women form local clubs and then communicate with the county agent or the state agricultural college. In this way it will often be possible to secure a visit from the county agent or from the home economics expert.

WATER STUDIES IN HAWAII

The three principal crops of the Hawaiian Islands are sugar, rice and taro, and 90 per cent of these are products of irrigation. Water is therefore the life blood of the islands, and since 1909 the United states geological survey, in cooperation with the Territory of Hawaii and assisted by private corporations and individuals, has been carrying on an exhaustive investigation of the water resources of the islands. The latest result of this work is a report by C. H. Pierce and G. K. Larrison just issued by the survey as Water Supply Paper 336.

The investigations of stream flow in the territory are not complete, nor do they include all the streams that might advantageously be studied, but they embrace as many of the streams and ditches on the four larger islands (Hawaii, Kauai, Oahu, and Maui) as the available appropriations would allow. It is essential that records of stream flow should be kept during a period of years long enough to determine within reasonable limits the range of flow from the maximum to the minimum. The length of such a period manifestly varies for different streams. Experience has shown that the records should be kept from five to 20 years.



Simply "—because it's a Studebaker" is the strongest guarantee that you can want of the quality of this car. And you can readily see the reason, too, when you think what that name of Studebaker means to you—when you think of the confidence that your fathers and millions of other men have had in it for 63 years past—and THEN, think of the pride that Studebaker must have in a name that a NATION has trusted so long.

You know yourself that, in Studebaker's place, you'd spare no effort to make Studebaker Cars as GOOD as they CAN be. And that is what Studebaker DOES.

This is the reason that Studebaker manufactures Studebaker Cars COMPLETE in Studebaker factories. For COMPLETE manufacturing not only does away with the parts-makers' profits and *lowers the price*, but enables Studebaker to put *more* quality in its cars.

That is the reason, too, that Studebaker gives so much time, so much expense to the study of its steels and its design and its motor—to get *more* quality into them.

And that is the reason, too, that Studebaker, knowing the farmer's needs so well, has made this FOUR the ideal car for use on country roads—given it overabundance of power—made it EASY-riding and so EASY to drive that it answers the lightest touch of two fingers on the wheel—given it balance and alignment that cuts the UPKEEP cost to the bone.

But when you SEE this FOUR at your local Studebaker dealer's and see how much you can get for $985—and when he tells you of the National Service organization that guarantees you Studebaker Service wherever you go—you'll appreciate even more what it means to buy a car with a name you KNOW—to buy it

-because its a

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

GREAT EXPOSITION

We took our fourth look-in at the Panama-Pacific exposition the first of this week. We saw it when the first timbers were rising, a year ago on the completion of the palace of machinery, again in June when the main buildings were nearing completion, and again this week. The wonder of it all is that so much has been accomplished in the few months during which the work has been in progress. It is already a wonderful exposition; if not another day's work was done and the exposition remained as at present it would be well worth a visit by every Californian. The architectural work, the landscaping, but more than all the lighting, have made a fairyland of the mud flats along San Francisco bay. Some exhibits are already completely installed, and we are glad to say that those nearest completion are of greatest interest to agriculturists. Japan alone is making an exhibit well worth a long trip to see. A bit of China has been transplanted here and is already completely installed and ready for visitors. The state buildings are completed. Last Sunday a crowd of over 50,000 people visited the grounds, taking their last look before the closing of the gates during the 40 days preceding the opening day, February 20. Let all the world take notice and be on hand to honor this great exposition of the industries of the world.

ORGANIZE

In line with centralizing the powers of agricultural bodies of our state administration is the movement started at the recent State Fruit Growers' Convention to centralize the agricultural interests of the state in one organized body. There are live stock breeders' associations, several of statewide influence; bee keepers, poultrymen, date producers, raisin and citrus men and others have their separate organizations. It is now proposed that there be one centralized body to watch after the welfare of all producing interests of the state. The movement started at Los Angeles had in view one or two plans, one which is inclusive and referred to on another page, while the other was simply an organization of fruit growers like the horticultural and pomological societies of various states. To determine as to which of the two plans should be accepted a committee of seven was appointed and this committee met in Sacramento last week. It appears to us that this is a step in the right direction, and to the end that this organization shall be launched in a way that will appeal to all classes a more general meeting has been called to be held in San Francisco, probably on the exposition grounds, on Monday, February 22. This is Washington's birthday and the second day following the opening day of the exposition. It will afford opportunity to the producers to get together and get a look-in at the great exposition and discuss this matter which is of such vital interest.

AGRICULTURAL LEGISLATION

A look-in at the 41st session of the state legislature gives an interesting view of our senators and assemblymen and the methods followed in starting legislation which concerns California. This is only the second week, so that the heaviest duties as yet performed have been the collection of mileage accounts and paying a few minor requisitions for preliminary expenses. Of course there have been many bills presented, but not as many by any means as were presented before the fortieth legislature in its early stages. It is to be hoped that this is indicative of the present session's attitude. However, there will be enough bills to keep legislators and lobbyists and citizens of the state as well reasonably busy in keeping informed as to the "needs" of our state. Of course many are going there with bills which it is not expected will ever pass, but with the hope of making a bit of capital, political or otherwise. But as a rule we think the most of our legislators gathered at Sacramento are in earnest in their effort to advance the state's interests. In addition to the legislators of course there are a few professional lobbyists. There are some producers and others of the state interested in securing better agricultural legislation. There is one committee, the greater part of whose members were appointed, we believe, by the State Fruit Growers' Convention a year and a half ago. This committee has been at work since its formation studying wherein agriculture in its larger sense could be benefited. Their efforts have resulted in the framing of a bill which will be presented soon if it has not been already in both senate and assembly.

This bill calls for the bringing of the state agricultural board, the state horticultural commission, the state veterinarian, and many others under the direct supervision of the state department of agriculture, or, more properly, under the state secretary of agriculture. It provides that "the office of secretary of agriculture is hereby created, who shall be appointed by the governor immediately after the taking effect of this act. His term of office shall be four years. He shall be paid an annual salary of $7500 and all official expenses." This department shall succeed to and be vested with the duties, purposes and powers of the following bodies: The board of agriculture, agricultural society, commissioner of horticulture, board of horticultural examiners, dairy bureau, board of examiners of veterinary medicine, veterinarian, board of sheep commissioners, stallion registration board, board of viticultural commissioners, board of forestry, forester, conservation commission, superintendent of weights and measures, Redwood Park commission, fish and game commission.

The department shall be organized into five bureaus, viz., animal industry, horticulture, forestry, fish and game and economics. Some of these bureaus again are made into smaller divisions, for example, in the bureau of economics there are three known as the divisions of land settlement, fairs and expositions, markets and statistics. The directors of these five bureaus, with the governor, shall be an advisory board to the secretary.

Civil service rules shall obtain in the appointment of all assistants, experts, clerks, inspectors, etc. In addition to the five bureaus named the secretary is empowered to create new bureaus if he finds necessity therefor, these to be with the approval of the governor.

The new bill provides that no sections of existing laws touching upon agriculture, especially upon enactments which have created the present commissions, be repealed by this act other than those sections which relate to the duties of the commissioner or chief of the commission created whose duties are now performed by the secretary of agriculture to be appointed. This officer is to be vested with the power which formerly lay in all the others.

Regarding the conduct of the state fair, the bill provides for the creation of a board of managers of six members, together with the chief of the division of fairs and expositions.

The matter of the salary which as presented to the legislature stands at $7500 caused considerable discussion in the committee; many thought it too high. The point was made by members of the committee opposed to the high salary that it was almost equal to that of the governor of the state, nearly twice as large as that of the lieutenant-governor and more than that of other state officials. The salary of the railroad commissioners is $6000 and they are amongst the highest salaried officials of the state. Others on the committee, however, appealed for a salary which would draw to the office a man of accomplishment and caliber sufficient to make this department a complete success.

On the part of the friends of the measure there is no claim for greater direct economy in handling the matters which are so vital to the farmer, but they do claim vastly greater efficiency, and efficiency means economy. We do not suppose the taxpayer will notice any difference for the first few years, but if as great success follows the change as is anticipated this state will set an example to other states of the union which will be largely followed.

It is estimated that the total loss due to the ravages of the army worm in Canada during the past summer was not less than $300,000 of which a loss of about $250,000 was experienced by the farmers in Ontario. These figures have been obtained as the result of an extensive inquiry conducted by the department of agriculture into the various aspects of the outbreak.

Agricultural Notes

Something over 80,000 acres in Sweden are planted to sugar beets.

Farmers in Sweden usually own their own farms. In 1911 only 14 per cent of the whole number of farms was rented.

A 10,000 herd of Jersey hogs is reported to have been shot and buried in Illinois because they were exposed to the foot and mouth disease.

The Canadian department of agriculture tests milk and butter fat yields of cows whose owners apply for tests under conditions prescribed by the department.

Guernsey breeders of Minnessota are planning to form a state association at a meeting called during the farmers' short course held at the university farm, St. Paul, early in February.

Two agricultural schools are to be established in Panama. One of the schools will be located near New Gorgona. The government is also contemplating the establishment of an agricultural experiment station.

Sets of lantern slides of agricultural subjects are loaned free by the office of farmers' institutes of the United States department of agriculture to speakers at agricultural meetings. A number of commercial firms are also making sets of such slides for renting to farmers' clubs.

Canada has a national records system which is jointly managed by associations of breeders and the department of agriculture. The executive committee is composed of one man representing each of the following classes: Heavy horses, light horses beef cattle, dairy cattle, sheep and swine.

The American steamship "Pathfinder" left Galveston December 25 for Bremen, with a cargo of cotton, 6,650 bales, the first cotton to go to Germany since the beginning of the war. The freight rate on this cotton, $3 per hundred pounds, is said to be the highest ever paid at the port of Galveston. A year ago the current rate was about 35 cents per 100 pounds.

The Pennsylvania railroad reports that the parcel post packages sent out in the mail cars of that road from New York and from Philadelphia in the seven days ending with December 24, numbered about nine millions. The Christmas rush was about 50 per cent heavier than a year ago. Three times the regular force of men to handle the mails had to be kept on duty at stations.

In Denmark the state has for a number of years carried out trials of root crops, for which any Danish seed breeder can enter his strains of seed. According to the results the strains are divided into three classes. The names of the breeders of the first class seeds are published. Owing to the great demand for seeds, prices rise very high and this stimulates the breeders to further exertions. Thus 10 shillings a pound is now paid for pedigree mangold seeds and 20 shillings a pound for turnip and swede seeds. The cooperation of state, breeder and seedman has already led to an increase in the yield of Danish root crops. Of late years the practice has been introduced of selling seeds of root crops with a guarantee as to their quality, as has long been done for grass seeds.

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County is experimenting with Tepary beans.

The Placerville Fruit Growers' Association has just been incorporated.

Yolo County stockmen are planning a large exhibit at the Panama-Pacific.

Mt. Pleasant has organized a unit of the Placer County farm bureau.

The prune yield for the state this year is estimated at more than 100,000,000 pounds.

Nurseries of northern California report heavy call for fruit trees of all kinds for spring planting.

Citizens of Gridley, Butte County, celebrated the opening of the new rice mill the last of December.

The Humboldt County Dairymen's Association held its annual meeting and banquet at Ferndale January 5.

Stockholders of the Cloverdale Citrus Fair Association have begun discussing plans for the next citrus fair annual.

County Horticultural Commissioner Harney of Yuba County is urging all farmers to destroy Russian thistle on their property.

Many growers of Shasta County are planning to set out new acreage to walnuts this year, mostly of the Franquette variety.

Onion growers of Yolo County are rejoicing over the big advance in onion prices, which have practically doubled the last two weeks.

Sacramento County has the largest acreage of pear orchard in the state, having 2900 acres in bearing trees and 2000 in non-bearing.

State Horticultural Commissioner Cook and his deputy, George Weldon, addressed the farmers' institute at Grass Valley Saturday, January 9.

The Placerville Fruit Growers' Association has just been organized to affiliate with the California Fruit Exchange. J. A. Irving is elected president.

Humboldt County takes the banner for killing off the greatest number of mountain lions. Bounties paid in that county aggregate over 500 at $20 per scalp.

The Napa County Viticultural Protective Association met at St. Helena December 26 and passed resolutions in favor of drastic laws for regulation of the saloon busines.

It is reported that more than half of the hop crop of Mendocino and Lake Counties has been pledged to the newly formed hop growers' association for a term of years.

One of the largest olive packers in the state has stated that the 1914 pack of olives will run more to small sizes than that of last year but that quality will be about the same.

A new cow testing association is to be organized among dairymen of the river district of Sacramento and Yolo Counties. F. A. Edinger of Hood has been elected president of the new association.

The Gridley cow testing association which began work the first of October has added several new members and is finding the work most satisfactory. M. T. Machado is president of the association.

Central California

Four hundred and forty thousand bags of beans is the estimated output of the Delta region about Stockton.

The Tulare Cooperative Association during the month of November transacted a business which amounted to $3,560.

The Turlock Irrigation District will hold a general election February 3 at Turlock. Four directors are to be chosen.

A working model of the La Grange dam will be exhibited at the Panama-Pacific by the Modesto chamber of commerce.

Granges of California are arranging to keep open house at the Panama-Pacific Exposition to all visiting grangers of the United States.

A strong demand for raisins is reported from eastern jobbers. Practically all of the raisins will be shipped through the Panama Canal.

Citizens of the Alpaugh district of Tulare County have presented to the county supervisors a petition for the formation of an irrigation district.

In connection with the farmers' institute which will be held at the Hanford union high school January 15 and 16, a big exhibit has been planned.

A state produce commission bill is to be presented before the present session of the state legislature. The bill is practically the same as that presented at the 1913 session.

A herd of 26 Holstein Friesians has been added to the stock of a Tulare dairyman. The cattle were purchased in Arizona but originally came from the Nebraska state experiment station.

Beef steers to the value of $20,000 were shipped last week to San Francisco from Porterville. This brings the total shipments for the season from the Porterville Alfalfa Company up to 900 head.

The Pajaro Valley Poultry Association discussed parcel post shipment of eggs at its recent annual meeting. The following directors were elected for 1915: S. E. Elliott, M. D. McDougall, E. A. Hall, A. P. Creede, W. R. Triggs, J. E. Jamison and J. E. Trafton.

Farm Adviser Mayhew of Madera County has arranged for the coming of a department of agriculture expert in hog cholera treatment. He will be in Madera County the first of the year and will spend practically all of the month in demonstration work among the farmers.

A plan is proposed by the California Dried Fruit Association to incorporate in future contracts between growers and packers an arbitration clause. There will be a regular arbitration board appointed to serve on pay. Heretofore differences have necessarily been taken into court for settlement.

The Modesto farmers' union, at its recent annual meeting, elected the following officers: D. F. Conant, president; D. M. Hackett, vice-president; J. C. Galloway, secretary-treasurer; A. L. Rutherford, lecturer; Chas. N. Odell, conductor; Dan Grundy, doorkeeper; Rev. J. W. Webb, chaplain; J. K. Corson, Guy H. Miller and C. L. Sanders, executive committee.

Southern California

Auto bus service has been installed between Los Angeles and San Diego.

Imperial County ranks second among the butter producing counties of the state.

The Heber cotton gin is operating full blast. It is receiving carloads of Mexican cotton daily.

Sixty-five carloads of cattle from the C. M. ranch in Mexico arrived in Los Angeles last week.

The dried fruit output of the Hemet Valley is practically all sold. The sales already total 20 cars.

There are now in bearing, according to government report, 1500 date palms in Southern California.

From Imperial Valley comes assurance that a government land office will soon be located in the valley.

A bill is coming up before the present session of the legislature to compel inspection of citrus fruit for frost injury.

H. L. Carnahan of Riverside has been appointed corporation commissioner under the recently enacted blue sky law.

Most comprehensive investigations in citrus problems are planned for the citrus experiment station located at Riverside.

Rangers in the Santa Barbara national forest are planting grain along the mountain streams for government horses and mules.

The Santa Fe railroad values the 1914 output of the fruit canneries of California at between $19,000,000 and $20,000,000.

A shipment of six carloads of celery left San Francisco for New York via the Panama Canal the last day in December.

The San Luis Rey farm bureau met January 6. The principal topic of papers and discussions was the growing of lima beans.

A meeting was recently held in Thermal, Riverside County, of those interested in date culture to frame a bill calling for stringent inspection of date offshoots.

Southern California lemon growers have organized a cooperative company subsidiary to the California Fruit Growers' Exchange, to keep off the market the inferior lemons and to utilize the unmarketable part of the crop by diverting them into by-products, such as citrate of lime, oil of lemon and other similar commodities. The company will be known as the Exchange By-Products Company, and will be incorporated for $100,000.

Cotton growers of the Imperial Valley and the Salt River Valley of Arizona are fighting the proposed increase in rates on eastern shipments of cotton. The former rate of 95 cents per 100 pounds included privilege of compressing in transit. Under the present railroad ruling this privilege is denied and growers will be compelled to ship their cotton to compressors before loading, which will make the rate about $1.05 per 100 pounds.

The Coast

There is some talk of a creamery being established at Willcox, Arizona.

Sugar factories operated in half a dozen towns of Utah and Idaho have been united under one management.

Farmers of Lehi, Utah, have organized a farmers' club which will interest itself particularly in the marketing side of farming.

September 7-11 are the dates decided upon for the International Sheep Show and auction sale to be held in Salt Lake City next fall.

An Oregon sheep man was recently fined $100 for shearing sheep in midwinter. He also lost several of his sheep from exposure to cold.

The recently enacted Arizona antialien employment law has been declared unconstitutional by the federal district court at San Francisco.

Thirty-one carloads of horses, 850 in all, were shipped in one day from Walla Walla, Washington, to New Jersey to be loaded on boats for France.

The annual meeting of the Arizona Poultry Association was held at Phoenix January 9. It is planned to publish a year book with directory of members.

Prizes for dairy cattle are announced by the management of the Cascade International Stock Show to be held in North Yakima, Washington, next fall.

The Utah Wool Growers' Association met in Salt Lake City January 11. The Utah Shearers' Association also met at the same time and place.

Sugar beet contracts in Utah were 25 per cent greater during 1914 than in 1913. Next year it is estimated that they will be 25 per cent greater than this year.

Work on irrigation districts of the Yakima Valley in Washington during this winter will cost, it is estimated, some $800,000. The Indian service alone will expend some $125,000 on reservation canals.

The state board of sheep commissioners of Montana has recommended to the state legislature the creation of a contingent emergency fund to be used in case of the reappearance of the foot and mouth disease.

Several shipments of apples have gone out from the Spokane district recently bound for European ports. The apples demanded by the export trade are smaller than those called for by the home market and must be well colored.

The Washington State Dairymen's Association held its annual convention at Chehalis the middle of December. At the same time the Washington State Holstein Breeders' Association and the Washington Jersey Cattle Club held their annual sessions.

The members of the Yakima by-products committee has submitted definite plans to members of the fruit products company. They expect to establish by-products factories in various districts to take care of cull fruit belonging to members of the association.

STUBBLE HOGS

Written for California Cultivator
By Sacramento Valley Contributor

THE hog on a California grain farm is often a byproduct. To make money from the grain that shatters out of the ripe heads or those heads which the harvester cannot get either because the straw is too short or not stiff enough to stand up is the mission of the animal. Consequently the hog gets the worst of it, speaking strictly from the standpoint of the hog business, not the grain raising industry.

In some respects the stubble hog is like the "razorback" of the southern states and the "prairie rooter" of the middle west. Ability to rustle for itself, to put up with all sorts of conditions and to withstand much grief are characteristics of all of these "not quite domesticated" animals. They have stamina and endurance that would do credit to a standard bred horse and are able to cover many square miles of territory in search of food. At market time they are able to walk miles to a shipping point without injury. Some of them are very prolific, although the general average of pigs raised per sow is not large, for a number of reasons. One is that many young sows with their first litter are always included in a bunch and the loss from exposure or accident is necessarily greater than with hogs receiving better care. And it is undoubtedly true that sows subjected to periods of short feed for several generations—perhaps during the period of gestation or at farrowing time—would have a tendency to decreased litters, as a matter of natural self-protection to the race and the survival of the species, just as undernourished trees produce fewer fruits. From nature's viewpoint a few strong ones are more apt to survive than more not so vigorous.

These half wild sows are wonderful mothers, however, and will fight for their young like demons. The baby pigs have little to fear from dogs or small wild animals while the sow is around.

Most "Stubble hogs" come of very mixed ancestry. They are literally "ringed, streaked and speckled." There is evidence of the Duroc Jersey in the red coloring, of the Poland China and Berkshire in the black hair and facial conformation of different individuals, and of the Chester White in larger areas of white than could well come from the white markings on the Poland China or Berkshire. And without question there is a considerable percentage of "just plain hog" in the almost unknown and hard to trace pedigree of these money-making members of California farmdom.

Many people coming into California from other states—hog growing districts particularly—are prone to criticise our California hogs. They object to their conformation, saying that they will not dress out as profitable carcasses as the better representatives of eastern herds, that their legs are too long, their hams too light, and that in a way they are built more for speed than meat. Some, who see only a part of our grain country in a brief, casual survey of California and who do not see our fine pure-bred herds, might go back home with the idea that California is a poor place to raise hogs and that California hogs are a poor lot, little knowing that with climatic conditions as they are in the east hogs grown as these are, in the open and with little or no protection and having pigs at any time during the year, would not survive in their country at all.

Then there are other people coming to California to make homes on small but rich irrigated farms who may get the idea that the way the old timer raises hogs is the way to do it here. They may not consider the fact that hogs are only a secondary matter with the grain farmer and that if at 18 months of age they weigh only 200 ponuds it is not a vital matter with him because they have lived almost exclusively on feed that would otherwise be waste, but that on their own intensely cultivated farms they must make the best of everything and that it is quite as essential for them to make a 200-pound hog in seven or eight months as it is in any eastern state and that it is much easier to do it here.

Now there is this suggestion to be made regarding the stubble hog. The small farmer has no use for it—as it is described above and generally grown. His hogs must have all they can eat from birth to maturity, and while stubble feed can and should form a part of the ration in season the hog must not be made to rustle after all the feed is gone and all he gets is exercise, as is the case with many "big-farm" hogs.

And on the big grain farm the hogs will certainly pay for better feed and care. By eliminating the "lean" spells of short feed much more in value can be marketed per year, certainly much more than enough to pay for the feed it would take to accomplish it.

There is something worth while for hog growers to think about along this line of more feed and better care even though conditions permit some profit without it.

CALIFORNIA DRAFT HORSE BREEDERS

Since the annual meeting of the California Draft Horse Breeders' Association at the last state fair the organization has shown considerable activity, being determined to secure more attention to this particular branch of California farming. Secretary Thompson has mailed to members copies of the constitution and by-laws, which we reprint for the benefit of all horse owners. The association should be encouraged in its efforts to advance the breeding of better horses on the Pacific Coast.

Constitution

Article 1, Name—This organization shall be known as The California Draft Horse Breeders' Association.

Article 2, Object—The object of this association shall be to promote the horse breeding industry of the state;

Nice Bossy--Father Says You're Giving an Awful Lot of Milk Now!

It is a common thing to hear cow owners express their enthusiasm for *Kow-Kure* after using it on sickly or "backward" cows; and no wonder. *Kow-Kure* has such a wonderful effect on the genital and digestive organs that many cow ailments commonly regarded as very serious can be prevented or promptly relieved by following the simple directions. If you have never used *Kow-Kure*, we want to send you our useful free treatise on cow diseases, "The Cow Doctor."

You can buy *Kow-Kure* in 50c or $1.00 packages from druggists and feed dealers.

1st—By holding an annual meeting for the discussion of matters of importance to the industry and adoption of measures for the furtherance of the business interest of its members.

2nd—To bring into closer relationship the farmer, breeder, seller and buyer.

3rd—To encourage the organization of township and county horse breeding associations.

4th—To advocate and introduce cooperation in horse buying, breeding and selling.

5th—To disseminate educational matter looking to a better knowledge of the principles and practices of horse breeding, rearing, feeding and management.

6th—To assist in the observation and enforcement of existing legislation relating to ownership of stallions for public service and to frame and urge the adoption of new legislation favorable to the interests of the horse breeding industry.

7th—To assist farmers and breeders in obtaining pure-bred stallions and making sales.

8th—To encourage proper classification and premium lists for horses at state and county fairs.

9th—To discourage the use of unsound stallions and mares for breeding purposes.

10th—To encourage the use of pure-bred stallions and educate against the use of grade and cross-bred sires.

Article 3, Membership—Section 1: Any horse breeder, farmer owner or importer of stallions, officers of an agricultural association, teacher of animal husbandry or agriculture, editor or publisher of livestock or agricultural newspapers, or graduate veterinarian shall be entitled to become a member of this association.

Sec. 2: Honorary membership may be conferred upon any party interested or active in advancement of the horse breeding industry by a majority vote at any annual or special meeting of the association.

Article 4, Dues—A fee of five dollars shall be collected from each member annually.

Article 5, Officers—Section 1: The officers of this association shall consist of a president, vice-president and secretary-treasurer whose terms of office shall be one year, or until the successors are elected.

Sec. 2: The executive board of three members to act with the president and secretary of the association, who shall be ex-officio members.

Sec. 3: A vice-president in each county in the state to be appointed or elected at each annual meeting, or by the executive board where a county happens not to be represented at the meeting.

Article 6, Duties—Section 1: It shall be the duty of the president to preside at all the meetings of the society and enforce the observance of such rules and regulations as will be for the best interests of the organization; to appoint all regular committees as he may deem expedient for the welfare of the association.

Sec. 2: In the absence of the president, the vice-president shall preside and perform all duties of the president.

Sec. 3: It shall be the duty of the secretary-treasurer to keep all records of the association; to report the results of all cooperative work carried on by its membership and the experiment station; plan the experimental work as far as possible for the members of the association; collect all fees, keep secure all funds of the association and pay out money upon the written order of the president; and labor for the welfare of the society in general.

Article 7, Amendments—This constitution may be amended at any annual meeting by a two-third's vote of the members of the association present.

By-Laws

Article 1: The officers of this association shall be elected at the annual meeting.

Article 2: The president and secretary shall be ex-officio members of the executive board.

Article 3: All members joining at the organization of this association shall be known as charter members.

Article 4: The annual meeting shall be held at such time and place as the board of directors shall direct, and notice of such meeting shall be given at least two weeks before the time of meeting.

A JERSEY BULL FOR THE HAWAIIAN ISLANDS

The Jersey Queen Farm of San Jose has just shipped to Mrs. P. Isenberg of Honolulu a highly bred yearling bull to head her herd of registered Jerseys. The youngster carries a good per cent of Stoke Pogis of Prospect blood, being sired by Victor Hope's Victor, who is a grand son of the above bull. His dam is Emanon's Lady Bell and a most beautiful cow with perfect udder, beautiful head and body. Her grandsire was Emanon Imp., grand champion at the Chicago Exposition. She is a 45-pound cow, testing 5.8 fat. The price paid was $250.

COW TESTING ASSOCIATIONS

California is forging ahead rapidly in the interest that many of her dairymen are showing in testing their herds through cooperative organizations. In proportion to the number of cows in the state it is doubtful whether any other state measures up to her in this respect. These organizations are now covering all parts of the state and many thousand cows are held to a systematic accounting for what they are doing for the feed they consume and the care they get from their owners. One association in Humboldt County has 3,800 cows under test and as it increases every year the dairymen who participate in it must be getting satisfactory results.

With butter selling at 29 cents in December and beef animals being in good demand it is timely that we go after the unprofitable cows, show them up and send them to the butcher. Unless we miss our guess there will have to be a readjustment of things along dairy lines in California. The high prices of recent years under which any kind of a "critter" and any

kind of a dairymen could succeed are seemingly over. It is going to require efficiency to stay in the dairy game and all that means good cows. There is likely to be a lot of noise about low prices, but it won't be so noticeable from members of cow testing associations if they make the proper use of the light that their work throws into their paths.—Pacific Dairy Review.

PORK SAUSAGE ON THE FARM

In making sausage, only clean, fresh meat from healthy animals should be used and this meat should be thoroughly chilled after killing the animal. Meat for sausage is generally taken from the shoulders, neck, and other lean trimmings, and pork fat is taken from the neck or back. In case beef is added, it may be taken from the cheek, neck or other lean trimmings.

There are numerous ways to compound pork sausage. Lean pork trimmings, or the same with a small amount of fat added, or combinations of beef and pork trimmings may be used, with varied selections of spices. The meat is first run through a chopper with a ¼-inch plate. It is then spread out and spices sprinkled over it and thoroughly mixed. To insure a more thorough mixing it may again be run through the chopper.

Spices may be selected to suit the occasion or the taste of the sausage maker. The spices used and the amount for 100 pounds of meat are as follows: Salt 1½ to 3 pounds; saltpeter 1 to 3 ounces; sugar 5 to 10 pounds; ground white pepper 8 to 10 ounces; sage, rubbed fine, 4 to 12 ounces; mace ½ to 1 ounce; garlic 1 to 2 ounces; coriander 3 ounces; onions 4 to 8 ounces; black pepper 8 ounces; mustard seed 2 ounces; ginger 2 ounces; nutmeg ¾ ounces, etc.

From the above list any desired selection may be used. When beef is added it is generally used in proportions of 20 per cent beef and 80 per cent lean pork trimmings. Some prefer more beef and make the proportion 45 per cent beef to 55 per cent pork.

Pork sausage may be stored in earthen jars or crocks and covered with a layer of lard or it may be stripped into casings made from the small intestines of the hog. Casings can generally be purchased from the butcher shops ready for use.—H. S. Eakins, Colorado Agricultural College.

SUDDEN DEATHS IN A SILO

A recent fatal accident in Ohio calls attention to a danger to farmers which cannot be too widely circulated. Since 1875, when the first American silo was built by Dr. Manley Miles, this method of preserving forage for livestock has been generally adopted. Although the department of agriculture has frequently called attention to the danger of carbon dioxid gas accumulating in silos under certain conditions, no fatalities have been reported heretofore. On the morning of September 19 four workmen on the farm of the Athens (Ohio) state hospital ascended the ladder on the outside of a silo to an open door about 12 feet from the top and jumped down one after another onto the silage, the top of which was about six feet below the door. About five minutes after two other workmen following them found them unconscious. Although a large force of workmen were immediately summoned and the bodies of the four men removed at once through a lower door, the physicians of the hospital who were at once on the ground were unable to resuscitate any of the four men. Evidently the carbon dioxid gas had accumulated during the night, filling the silo up to the level of the door and forming a layer of carbon dioxid gas six feet deep. Such accidents, says the Journal of the American Medical Association, might easily be repeated on any modern farm. Agriculture journals should call the attention of the farmers to this danger and should urge that silos be carefully ventilated before being entered.

FACTORS IN SUCCESSFUL DAIRYING

THE MAN
- Dairy minded
- Keen to learn and attentive to details
- Active in cooperation
- Determined to win

THE FARM
- Well organized
- Well stocked
- Well tilled

THE COW
- Dairy bred
- Well grown
- Properly fed
- Profitable

THE PRODUCT
- Of superior quality
- Satisfactorily marketed

THE MARKET
- Well established
- Carefully maintained

—G. C. Humphrey, Wisconsin Ex. Sta.

OLD DOORS FOR HOG HOUSES

Written for California Cultivator
By Sacramento Valley Contributor

In every large city there are concerns that make a business of wrecking houses and other buildings that must be torn down to make way for bigger and better ones or that must be torn down for some other reason. These house wreckers generally have on hand second hand doors and sell them at low prices, frequently at 25 cents apiece. Four doors set up together, two on a side, nailed together at the top and toenailed to a frame made eight feet wide and a little longer than the width of the two doors makes a fine A-shaped hog house at a very low cost. One end may be boarded up, and if the frame on which the "wigwam" is erected is made strongly enough this house may be easily hauled to any part of the farm.

Such a house will provide a dry bed for a sow and litter or for several growing or mature hogs in the winter season, and in summer it will make good shelter from the sun.

THE IMPROPER USE OF DRUGS

Frequently drugs are administered by people without any knowledge of their action. One individual only recently asked what he should give his horse when aconite and nitre had failed to cure. It is always best for one to know the action of a drug before it is administered to livestock. A thorough study of the symptoms of the animal should be made before any drugs are given. Just because certain drugs have succeeded in some neighbor's horses, there is no reason they will cure yours. To illustrate—a horse is suffering from colic. A dose of opium would be correct to give if it is spasmodic colic, while if the patient has impaction of the bowels a dose of opium would only pack the bowels the harder. A dose of aconite should never be given when the heart is weak and slow, for the reason that aconite depresses the heart and will cause death. On the other hand, aconite would be the proper drug to give when the heart was beating full and strong and very rapid. A common mistake is to give horses sweet spirits of nitre when suffering from frequent urination, as this drug is a diuretic or increases the flow of urine. It only aggravates the trouble in this particular case.

In diseases of the respiratory tract when the high fever has caused constipation one should never use aloes on account of the danger from superpurgation. Raw linseed oil is preferable as it is much safer.—Dr. C. L. Barnes, Colorado Agricultural College.

FARM SURGERY AND THE ZODIAC

About 4000 years ago the fantastic mind of the Babylonian divided the belt of the heavens through which the ecliptic runs into 12 equal parts of 30 degrees each. To each part was given the name of an animal such as ram, bull, crab, lion, etc., and these animals were fancied to possess a magic influence over animal life on the earth. The ram influenced the head, the fishes influenced the feet and so on throughout.

Now the moon completes its journey around the earth through these twelve parts of the zodiac in about 28 days. When the moon is in that part called the ram we say "sign is in the head," when the moon is in the fishes we say "sign is in the feet," etc. Each "sign" is of about two days and eight hours duration.

These "signs" were imagined to have a mystic effect on bodily injuries and our fathers have been particularly wary not to brand or unsex animals if the "sign" should be in a vital organ.

We can hardly conceive of a purer myth, and yet the superstition lingers. How long the way from the mystic to the scientific.—S. L. MacDonald, Colorado Agricultural College.

BARLEY FOR HOG LOTS

On a great many farms there are hog lots that for one reason or another will not be used from now until the middle of next summer. It is a fine thing to plant such to barley or wheat. The soil is rich—almost too rich—and it will be "cashing" a valuable deposit of fertility that would otherwise be wasted, at least in part, by leaching if some crop is not planted. Then the growing of a crop of grain will sweeten and clean the soil so that it will be fresh and clean next fall. Then a lot of good grain to "hog off" next May will surely not come amiss and the hogs will harvest it free of charge.

DE LAVAL BUTTER
Best as usual
at the great 1914
National Dairy Show

BUTTER made from cream separated by De Laval Separators made the usual clean sweep of all highest awards at the great National Dairy Show held in Chicago in October, 1914, as it has always done at every convention of the National Buttermakers' Association or a Dairy Show since the beginning of these important annual contests in 1892.

The Sweepstakes and Gold Medal awards in the various classes were as follows:

Whole Milk Creamery Butter

The highest award in the Whole Milk Creamery Butter Class was made to Thomas Sadler, of Oelwein, Iowa, upon butter made with a De Laval Power or Factory Separator—score, 96½.

Gathered Cream Creamery Butter

The highest award in the important Gathered Cream Creamery Butter Class was made to the United Dairy Co., of Chicago, which uses both De Laval Separators and Milk Clarifiers, the prize winning butter being made from cream gathered mainly from farm users of De Laval Hand Separators—score, 96¼.

Farm Dairy Butter

The highest award in the Farm Dairy or Home-Made Butter Class was made to Austin C. Higgins, of Andover, Mass., who happily is not only a De Laval user but a De Laval Local Agent—score, 96.

De Laval Superiority Indisputable

Aside from the Sweepstakes and Gold Medal awards in all classes, the great majority of all other awards and higher scores were likewise given to De Laval users, again overwhelmingly demonstrating the superiority of De Laval dairy products, as at every important quality contest the world over for more than thirty years.

The reasons for the superiority of the De Laval on the farm and in the creamery, will be made plain by a De Laval catalog which will be mailed upon request.

Poultry for Profit

THE GREAT MID-WINTER LOS ANGELES POULTRY SHOW

Written for California Cultivator
By Frank Ironmonger

THE Poultry Breeders' Association of Southern California held its tenth annual exhibition of poultry and pet stock January 6-12, 1915, inclusive, in the Broadway Skating Rink, 1037 South Broadway, Los Angeles. The association has a live membership of upwards of 250, all endeavoring to perfect their favorite breeds and accomplishing big results.

The officers of the association are: J. L. Harrison, president; E. E. Emmerson, 1st vice-president; Geo. W. Masterson, 2nd vice-president; H. H. Mumford, secretary and treasurer; H. D. Armstrong, auditor, with directors W. S. Macy, W. J. Stewart, W. T. Blakely, W. M. Rose, A. A. Bamford, C. G. Weaver, Dr. G. I. Royce and Geo. C. England. The judges and their classes are as follows: W. S. Russell, Ottumwa, Iowa, Plymouth Rocks and Rhode Island Reds; Chas. G. Hinds, Oakland, White Wyandottes, Asiatics, Minorcas, Andalusians, Anconas, Campines, Lakenvelders, Cornish; Geo. W. Masterson, Duarte, all Wyandottes except White, all Leghorns, Spanish, Partridge Orpingtons, Hamburgs, Houdans, Games and Bantams; A. G. Goodacre, Compton, all Orpingtons except Partridge, all Dorkings, Red Caps, Buckeyes, Sussex, Polish, Buttercups, turkeys, ducks, geese and guineas; M. A. Schofield, Gardena, breeding yards; Robt. V. Moore, Los Angeles, rabbits.

The show as a whole was a grand success and the best staged exhibit of its kind ever held in Los Angeles. The aisles were wide and roomy so that an exhibitor was able to converse with a prospective customer and still be out of the way of the visiting public. A generous supply of clean wood shavings was kept in the aisles, giving a neat appearance and easy under the feet.

One important feature adopted this year and one that should have been practiced before is the tacking of a thin strip of board to the front edge of the projecting table on which the coops are placed, which prevents the water cups from being knocked into the aisles and the soiled bedding from the coops scattered under the feet of the visitors.

Heretofore double-decking has been very awkwardly handled, the second or top tier of coops being so high that it was impossible to see the birds. This year the lower tier was placed about two feet from the floor which brought both rows in full view.

The skating rink was the largest available space near the center of business but was far from the required capacity, consequently some 400 or 500 birds had to be refused admission. The bantams were staged on a balcony and the pigeons housed in a large storeroom on Main Street.

Right here we would like to say that if anyone tells you there are only one or two men who can pull off a successful poultry show, you can justly deny the statement and tell them there are others, for Henry Mumford with his many assistants can sure do the act to the queen's taste without any fuss or confusion.

The classes were well filled with the best quality shown anywhere in the United States, and the winners should feel very highly complimented on their winnings. The loosers have no cause for disappointment for a great many of the birds not placed would have won in almost any other exhibit in California, and California has good ones.

One of the special features was a Japanese Long Tailed fowl exhibited by C. Tsuchida in a specially constructed exhibition cabinet with glass front. The tail of this male bird measured over five feet. A value of $350.00 was placed on the bird.

The Plymouth Rocks carried off the laurels for numbers, 331 being exhibited, the Rhode Island Reds second with 197. The Orpingtons and Wyandottes tied for third with 160. The Sussex were fourth with 130, the Minorcas fifth with 118. The largest variety shown was the Single Comb Rhode Island Reds, 186, the second Barred Plymouth Rocks 172, third Single Comb White Leghorns 68, fourth Spangled Sussex 62, fifth Buff Plymouth Rocks 59.

The largest display of bantams was the Games with 48, Cochins second with 24, Sebrights third, 15.

The Orpington-Sussex Poultry Yards of Sawtelle had the largest entry of poultry, numbering 126 head, 118 of which were Sussex, this being the largest display of Sussex ever shown on the coast. R. A. Rowan, Pasadena, entered the largest string of bantams, 38. Chas. D. Stearns, Los Angeles, the largest list of turkeys, 25. Caldwell Brothers, Los Angeles, the largest entry of rabbits, 31.

There were 217 exhibitors, which is a good percentage of the associations' membership, which goes to show that most all the members are breeders of fancy poultry.

The judges all spoke in high terms of the quality of the fowls exhibited and the condition they were shown in was all that could be asked.

Sixteen breeding yards, each containing eight females and male were cooped on the floor and in the middle of the room. Although these were judged according to their commercial value, quite a number of the specimens would stand a good chance in the exhibition coops.

The Los Angeles Pigeon Club being unable to obtain space in the poultry exhibition hall held their fourth annual exhibit at 1035 South Main Street. The officers, John Benton, president; J. A. Smith, vice-president; J. R. Mathews, secretary; T. S. Brown, treasurer; W. M. Ross, show superintendent, and Joseph Trieb, deserve credit on the decorative and systematic arrangement of the exhibition hall, which was artifically lighted in such a manner as to give each coop equal advantage.

The room was filled with a quality of pigeons seldom seen in a showroom. By the combined efforts of the 110 active members of the club and visiting breeders the entry list reached 700 high class birds, 102 of which were Carneaux and 60 White Kings. W. J. Head, West Berkeley, and Robt.

THE COUNTRY GENTLEMAN

The big $1.50 farm paper, will be mailed to you 3 months—

13 Weeks—25 Cents

THE COUNTRY GENTLEMAN treats farming as a business—not only *growing* stuff, but *selling it at a profit*—the chief end of any business.

These 13 issues, for 25 cents, would make a book of nearly 1,000,000 words and 800 illustrations, covering more than 500 farm subjects, divided about as follows:

General Farming	95	Articles
Livestock	75	"
Marketing, Management and Finance	60	"
Buildings, Equipment and Labor	45	"
Poultry	55	"
Vegetables, Flowers	60	"
Dairying	25	"
Orchards and Trees	45	"
Rural Social Life	25	"
Home Making	55	"

Free Personal Service

Any farm question that puzzles a reader of THE COUNTRY GENTLEMAN will be answered personally and promptly *by mail*. More than 100 practical experts are at our call to render this free personal service.

Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

COULSON COMPANY

Send five cents for postage on free books, and state what crops you are growing.

NITRATE AGENCIES COMPANY

W. S. SPARR, Agent 321 Stimson Bldg., Los Angeles, Cal.

V. Moore, Los Angeles, judged the utility varieties, and R. W. Wales, Iowa City, Iowa, and Robt. V. Moore the fancy varieties.

The attendance far exceeded expectations, which indicates the increasing popularity of the pigeon industry in California.

The largest entry was made by C. R. King of Haywards, with 125 birds. He also won the cash prize for best display of fancy and utility stock; also cup for best display of one variety pigeons. W. H. Alkire of Hollywood, furnished a fine display of rare birds besides pigeons. Among this collection was a pair of African cranes, Mandarin ducks and pheasants. Mr. Alkire also won the cash prize for the second best display of fancy and utility pigeons.

The fanciers of Oakland were down with a long string of birds and several of them came down with their favorites.

The rabbits attracted their share of attention and a fine lot of specimens were shown. The rabbit men are enjoying a good business both in the fancy and market lines. There is no reason why they should not, for the meat equals the meat of any chicken and they are easily raised and very prolific.

There were 1573 head of poultry, 133 bantams, 57 turkeys, 18 ducks, 4 geese, 700 pigeons, 5 guineas and 291 rabbits, making a grand total of 2782 specimens.

The show catalogue should be in the hands of every breeder as it contains the winnings of each exhibitor and the addresses of all the members of the association as well as the exhibitors. It can be had by sending 25 cents to Henry H. Mumford, 623 Prospect Avenue, South Pasadena.

Following is a list of the winnings taken from catalogue:

Toulouse—All awards, E. F. Spence.

CARE OF EGGS FOR HATCHING

Eggs are often spoiled by careless handling. This is particularly true of eggs which have been shipped. A thoughtless person will unpack the eggs at once and place them in the nest or incubator. Some will even go so far as to shake the eggs, "just to see if they will rattle." As a matter of fact, when the air is excluded for a certain length of time, an egg that is perfectly good will rattle a little, but we would not advise this method of testing. It is too expensive.

When the package arrives see that the covering is secure; then invert the basket carefully and let remain undisturbed for several hours where the temperature is say from 50 to 60 degrees.

When saving eggs from your own flock, be careful not to let them get chilled, and never allow any one with soiled hands to gather the eggs. A very little grease or oil on the shell of an egg will render it worthless so far as hatching is concerned. If an egg has become soiled in the nest, it may be washed in clear tepid water. Never use soap or alkali of any description for such purpose.

We like to set eggs the same day they are laid, but sometimes it is not convenient to do so. If eggs are to be kept for a week or over, they should be given special care in order to insure a good hatch. We wrap the eggs in paper, with the date written on the wrapper. Then they are placed in boxes and turned carefully every day until placed for hatching.

The temperature should be neither too high nor too low, although the wrapping helps to overcome difficulties along this line. A damp cellar is a poor place to keep eggs. They should never be kept near a fire.

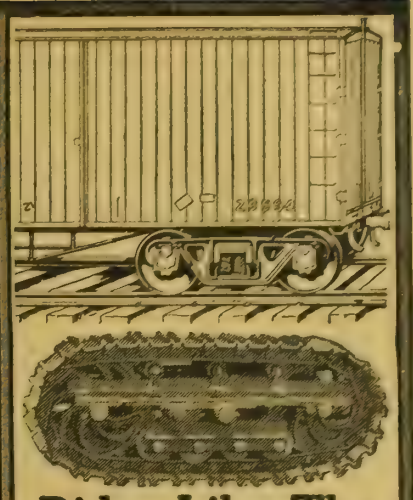
If eggs are properly cared for they will hatch almost as well when several weeks old as fresh eggs, that is, if they are good for hatching purposes in the start.

We find that the eggs of some fowls will keep in hatchable condition longer than others. Hen's eggs will not hatch well, as a rule, when they are over two weeks old. We have kept them 21 days with good results, but it is hardly safe to take chances.

Turkey eggs and goose eggs will keep perfectly for 21 days and even a little longer. They should not be allowed to become chilled in the nest, however.

Both turkeys and geese begin laying very early in the season and unless they are closely watched their eggs will get chilled, owing to the fact that they nearly always make their nests on the ground.

It is the same with ducks, also. But duck eggs should not be over a week old when placed for hatching. After a Pekin duck egg is ten days old it will not hatch, no matter how well it has been cared for. Duck eggs should never be shipped during very warm weather. In fact, it is not a good plan to ship any kind of eggs in warm weather, but duck eggs suffer more from the effects of rough handling than other eggs, because the albumen is so much thinner. It is best to procure duck eggs for hatching near home.—Indiana Farmer.



Rides Like The Car Wheels On Steel Rails

That's the plan of construction in the "Creeping Grip" tractor. It lays and carries its steel track. It rides smoothly, creeping over the soil with a firm grip. It loses no power in slippage—it never packs the soil—saves money in fuel bills because of the greater power delivered—at the draw bar. Here's the tractor that cuts the cost of plowing and gets crops in on time. The

"Creeping Grip" Tractor

can enter soft fields in early spring when other tractors must lie idle waiting for wet spots to dry. By comparison the creepers are lighter on the soil than an empty wagon. They climb and oscillate over obstructions, carrying the machine on a center axle. Two points of contact rest on the ground, thus avoiding jolts on the machine. The frame rides on 3 points of suspension, which eliminates binding on bearings—upkeep cost is reduced to a minimum.

Write for Catalog

Prices $950 to $4,250

Creeping Grip tractors have been tested and are now in use in all parts of the South and West. Let us tell you how you can save money with one on your farm.

The Imperial Valley, it is estimated, will this year produce 750,000 pounds of honey.

FERRETS

In an eastern exchange we note the following regarding an aid to the poultryman which is not often used in California:

In a pigeon loft a rat very deftly passed over a battery of steel traps, under a figure four and killed a setting Fantail pigeon within a few inches of a piece of poisoned meat. Poison, at best is dangerous, and must be used with skill to get the rat to eat it. More frequently he will completely ignore it.

With traps and poison relegated to the background there seems little left with which to combat this profit-destroyer. Let us look to his natural enemy, the ferret. Did you ever see a rat clear out when he became aware that a ferret was near him? It strikes him with the most profound terror; he will flee into the very face of a dog or a man, totally oblivious of all dangers except the alert little animal in pursuit. This is an enemy against whose onslaught he feels himself entirely helpless. A well-trained ferret will follow a rat until he either kills it or runs it out to where it can be otherwise dispatched.

The extermination of the rat does not end the usefulness of the ferret. The author for several seasons losing many chickens, bantams and ducks as a result of the nightly visits of minks, weasels, etc., conceived the idea of placing the ferret's cage near the roosting place of the poultry, hoping this would aid to keep away the marauders. The ferret emits a peculiar penetrating musk-like odor, which may be detected, under favorable circumstances, at quite a distance. The plan proved eminently successful. For the past three years I have had no trouble whatever from these pests. I am assured they are on the farm because I frequently find their tracks in the snow in winter, but they constantly maintain a respectful distance and my chicks are safe.

CHICKEN POX IN POULTRY

The following advice is given to an inquirer by Dr. R. H. Williams, animal husbandman of the university agricultural experiment station: Chicken pox or sore head affects various kinds of poultry, but is most noticeable in chickens and pigeons. It appears to be a form of roup, or at least closely related to this disease as they often go together. The general appearance of chicken pox will be noted in the growth of nodules on the skin of any part that is not covered by feathers. The comb, wattles, ear lobes and edges of the eyelids are the usual seats of infection. Single or large multiple nodules, somewhat greasy in appearance and of a dirty gray, yellowish brown or reddish brown color are the usual indications of the disease. The birds are often very sick and sometimes apparently not much affected. Incubation varies from a few days to three weeks.

Treatment

Sometimes recovery will take place without treatment, but about two-thirds of the birds will die if not cared for. The diseased birds should be isolated and the house disinfected thoroughly. Remove the crust or nodules and treat the sore part with a 2 per cent solution of creolin or corrosive sublimate solution 1 to 1000. After treating with these germicides iodoform should be dusted over the injured parts or even into the eyes, and finally an antiseptic healing ointment should be spread over the injured parts. Careful treatment will reduce the mortality to as low as 10 to 20 per cent.

It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles

GEESE

Thoroughbred Toulouse Geese—Large stock. One, two and three-year-old. Breeders for sale. $7.00 per pair, $10.00 per trio. Snapshot photo on request. A. E. Nelson, El Monte, Cal.

SEEDS AND PLANTS

For Sale—Gooseberry Bushes. Downing, Houghton, Red Jacket, Oregon Champion, Monterey; a few of an English sort. Each 15c, one of each 75c, $1.20 doz. Write for prices in larger quantities, p. p. paid. E. C. Hall, Gooseberry Specialist, Greenfield, Cal.

Strawberry Plants — Gold Dollar, Clark Seedlings, Magoons, Wm. Belt, Marshalls, Goodells, Early Ozark, and new Oregons, $2.50 per thousand. Thoroughbred plants. Mr. John Christiansen, R. F. D. 2, Canby, Oregon.

Sudan Grass Seed—We have a limited quantity of inspected seed that we are closing out at prices that will interest you. Write for our prices; it will pay you. Kimbro & Parks, Lubbock, Texas.

Sudan Grass—Government inspected, 50 cts. per lb. If you pay more you are throwing away your money. Amarillo Seed Co., Amarillo, Texas.

Berry Plants, Rhubarb, Cacti—It will be worth your while to send me a postal right now if you are interested. Louis F. Scribner, P. 2, Pasadena, Cal.

Sudan Grass, Kudzu, Imp. Alfalfa, Spineless Cactus—The big four forage plants. Prices O. K. Write, J. L. Lawson, San Jose, Cal.

Rhubarb—Crimson Winter, $3.00 per hundred; Wagner's Giant, $5.00 per hundred. Good, strong, one-year plants. Currier Bulb Co., Seabright, Cal.

For Sale—Avocado Seed, also fine budded "Taft" Avocado trees. C. P. Taft, Orange, Cal.

For Sale—Beldi Barley, clean for seed. H. Pile, Ramona, Cal.

Brandywine Strawberry Plants — Fine large plants. J. H. Shirk, Tulare, Cal.

Himalaya Berry Tips—$2.50 per 100; $15 per 1000. A Cooley, Sunnyvale, Cal.

RABBITS

Richey's Reds won again at Los Angeles famous show. Fine Bucks ready for service. Does bred to first prize winners, $3.00 to $5.00. Three months, $1.50 each. C. A. Richey, R. No. 8, Box 557, Los Angeles. Some prize winners for sale.

New Zealand Reds—Scored and sold on merit. Investigate. Our Catalogue is free. Caldwell Bros., Los Angeles, Cal., Box 613.

BEES

Beekeeping Pays Big—Price list, bees, instruction books, etc., free. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

IMPORTANCE OF ORGANIC MATTER IN SOILS

The following item on soil fertility is taken from the annual report of the bureau of soils:

Organic matter is essential to make a soil of what would otherwise be pulverized and more or less hydrolyzed rock, and while there are some soils capable of growing crops that contain small quantities of organic matter, on the whole the quantity of this material in average soils is considerable. The average organic content of soils amounts to approximately 50 tons per acre and yet the nature of this material has been but little understood. It has been believed for many years that it consisted chiefly of some such body as humic acid, differing perhaps in different soils, but having the same general properties. One prominent service which these investigations have rendered agriculture has been to show the nonexistence of humic acid and its hypothetical relatives and to show instead the existence of many compounds with many relationships.

This line of research has been especially profitable during the year just past, and the number of compounds isolated and identified has been increased to more than 40. Some of these compounds contain only carbon and hydrogen; some carbon, hydrogen and oxygen; some carbon, hydrogen, oxygen and nitrogen; others contain phosphorus or sulphur. Isolation in a pure condition of these organic constituents of soils has made possible the correct interpretation of the changes that organic matter undergoes in soils. The compounds found are recognized as representing decomposition products of fats, carbohydrates, proteins and other classes of natural compounds, and a great deal of light is shed thereby on the processes of humus formation and transformation in the soil. These researches into the nature and properties of soil organic matter have shown conclusively that the soil investigator must take into consideration the presence of organic compounds in the soil.

LEMONS FOR GRASSHOPPERS

Last summer Kansas had an unusual outbreak of grasshoppers. In places hundreds of hoppers to the square foot devastated every vestige of green, leaving the ground bare of plant growth as they passed. In fighting this invading army poisoned bran flavored with lemons and oranges was found most successful and was used to the extent of two millions of pounds. This practical test of a remedy of which a single application destroyed three-fourths of the grasshoppers showed it to be more beneficial than anything heretofore devised. The Kansas formula prescribes the following:

A. 1 pound of Paris green
   20 pounds of bran

Mix thoroughly in a wash tub while dry. Then stir in the following (B) well mixed.

B. 2 or three lemons or oranges, chopped fiine
   3 pints cheap syrup
   3½ gallons of water

The fruit juice may be squeezed in the water and the rind and pulp run through an ordinary meat chopper.

While the usual poisoned bran mash is eaten by grasshoppers the lemon bait greatly increased its attractiveness. Grasshoppers would leave succulent green corn or alfalfa for the bait and would be attracted from a distance of 50 feet. It is claimed that lemons are more efficient than oranges. In a test where 4000 grasshoppers were actually counted as they visited a series of different baits it was found that lemons attracted over 50 per cent more than where oranges, vinegar, stale beer or anise oil were used. In fact in this instance plain bran or plain syrup proved to be slightly better than when flavored with the latter substances.

The poisoned bran serves best when sown broadcast very early in the morning as the grasshoppers are then more eager for food and the mash then retains its moisture longer. When dried it no longer attracts the grasshoppers. From five to ten pounds of the wet mash is sufficient to the acre but it is best to apply it here and there to the worst infested areas. After a few days the poison may be again distributed if deemed necessary. Grasshoppers are slow to die but after once feeding on the poisoned bran will be almost sure to succumb in three or four days.

In this campaign against the grasshopper the county commissioners of western Kansas distributed at county expense nearly 700 tons of poisoned bran, allotting 200 pounds to each farmer. In two days after the treatment made on "Grasshopper Day" the ground was covered with dead grasshoppers, and at the end of what was considered to be the worst grasshopper year in Kansas history there were fewer living grasshoppers than there had been for many years. Such wholesale destruction of insects gives not only immediate benefit but its effects will be apparent for several years to come.—A. L. Melander, Entomologist, Washington State Experiment Station.

PAINT AND PRESERVATION

The value of paint in beautifying and preserving woodwork cannot be overestimated. It is to a large extent the visible index of a farmer's prosperity, progressiveness and intelligence. Rightly or wrongly, the farmer is often judged by the appearance of his buildings and farm equipment. Unpainted, ramshackle surroundings tell their own story. But the modern farm that deserves the name of up-to-date exposes very little lumber in an unpainted condition. The residence, barns, sheds, granaries and even the poultry houses, are painted. Decay is powerless to work much harm to the buildings belonging to such a farm.

Few expenditures that the farmer can make pay better than a judicious investment in paint, while the process of painting itself is not complicated. If one takes note of the character of the woodwork the maximum in benefit may be obtained. The kind of wood should be carefully studied and the painting regulated accordingly. It should be determined whether the timber is hard open-grain or hard close-grain; soft close-grain or very soft open-grain; soft and spongy; compact or solid, and also whether it is kiln or air-dried timber. If it is kiln-dried, and the drying process has been carried on too rapidly, the wood may have become case hardened, leaving it brittle and lifeless. The timber having thus lost part of its vitality, the paint must be mixed to a consistency which will penetrate to a depth that will insure satisfactory results. If the paint is of a heavy consistency and lies on the surface, the fibers of the wood will break away through contraction and expansion, bringing the paint with it. This trouble is always laid to the paint, while the real cause is that the primary coat was not properly reduced to penetrate a sufficient depth to insure proper binding. Wood that has been air-seasoned has had little or no opportunity to lose any of its strength, and it will hold paint well.

A little common sense reasoning will insure good results with this farmer's friend. There was a time when wood was cheap and paint dear, and it was a rare sight to see a painted building in a rural district. But let us not forget that times have changed and wood is dear with paint cheap. We hope that advantage will be taken of this fact by an increasing number of farmers during this year.—Farm, Stock and Home.

SAVE YOUR WOOD ASHES

Don't waste wood ashes. Apply them, as produced, to acid soils.

This is the advice of A. R. Whitson, head of the state soils laboratory. It is of particular value to settlers in upper Wisconsin, who actually have waste wood to burn.

Wood ashes contain a large proportion of lime which makes them of value in correcting acid soils. Oftentimes land intended for clover or alfalfa can be better prepared for the crop by a top dressing of fresh wood ashes, either hard or soft wood being equally satisfactory. Such a treatment will be of especial value on marshy and sandy soils.

If not allowed to leach out wood ashes are also rich in potash and so form a home source for a much needed element. Practically all of our potash supply has been imported into this country from certain of the countries in Europe now at war, which fact has caused considerable concern with many here who purchase in large quantities.

Mr. Whitson sees no reason for alarm over the potash situation. He does not think that the war will absolutely prohibit the importation of potash from German mines for any great period and, as he points out, the American supply is already being diluted in order to make it last.

Whether or not it will pay to use ashes for agricultural purposes depends upon the distance they have to be hauled. When buying ashes the purchaser should satisfy himself that the material is neither adulterated nor full of coal residue.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Vines Not Bearing

A subscriber at Selma inquires as to his Muscat grapes not bearing. The vines are thrifty but bear light crops. With this meager information Prof. Frederick T. Bioletti answers: "If your subscriber at Selma by 'thrifty' means vigorous, it is possible that he prunes his vines too short. It is a good general rule in the pruning of vines and of most trees that when the plant is perfectly vigorous and unfruitful more fruit buds should be left. In other words the pruning should not be so short. However, it may be that the frost spoils the blossoms in the spring. This would destroy the crop and incidentally invigorate the vine because all its energies would go into the vegetative growth instead of into the crop. In this case I should advise him to prune his vines very late, that is to say, after the buds at the ends of the canes have started to grow. This will defer blossoming a week or ten days and may save the crop from frost."

Treating Grain for Smut

I notice in the last issue of the Cultivator in an answer to a query regarding treating potatoes and seed grain for scab and smut the statement that seed grain should be dipped longer than potatoes. This is entirely wrong. A sack of seed grain need not be dipped over two minutes in formaldehyde. I speak from personal experience while a grain farmer in the middle west.—O. S. Lokka. We may add that grain is often treated by shoveling it over in a pile and sprinkling the formaldehyde solution through it as it is being shoveled. Where sprinkling of the grain is practiced oats and barley require more thorough wetting than does wheat.

Morning Glory

No question comes oftener than how to eradicate morning glory. A subscriber at Compton writes: "Will you please tell us if you know of any way to get rid of morning glory which has begun to show up in our orchard and is spreading rapidly?"

There is no royal road to the eradication of morning glory. Thorough cultivation is the best answer we can give. Occasional cultivation only aids in spreading if for the cultivator dragged through a patch of morning glory carries on its teeth broken roots to all parts of the orchard. These in turn start to grow and but two or three cultivations during the summer will be sufficient to cover the entire orchard within a year. If however, the infestation is in one or two small patches the cultivator may be put upon those patches regularly once a week and if not dragged through the orchard so as to carry roots to other sections eradication is comparatively simple. As to chemical treatment, as we have said many times, there is nothing which will eradicate morning glory without injuring the soil for the production of crops.

Root Knot

I have seven year-old Muir peach trees with black knot on the roots. Can I remove these and plant young peaches in the same places successfully?—Subscriber, Parlier.

This is probably the common crown gall and if other peach trees are planted in the same ground they might become infected. Often the old trees will bear and do fairly well for years after the infestation is apparent, and if such is the case with this particular orchard it might be more satisfactory to allow them to remain. Unless the gall surrounds the entire trunk of the tree it may be saved by chiseling away to clean, healthy wood and coating with Bordeaux paste, or if the knots appear on the roots they could be cut and removed. This trouble is not exclusively on peaches for many other varieties of fruits are affected.

Gophers

I wish to set prune trees in newly plowed ground, formerly in alfalfa, where pocket gophers were plentiful. What can I do to keep the gophers from eating the roots of the trees?—Subscriber, Parlier.

The only safe way to set trees in such ground is to give the gophers constant attention both before and after planting. There is no safety for the trees if the gophers are allowed to remain. Use traps and poison, which, with irrigation, should give reasonably quick control. We have heard of the roots of trees being surrounded when newly planted with close-meshed wire but this is expensive and impracticable. There is only one way of treating gophers and that is extermination.

Windbreak

What will make the best windbreak for apricot and peach orchard? Have heavy winds and sand storms. Must stand some frost and be of dense growth close to ground. Am considering Monterey cypress or possibly cypress interplanted with eucalyptus, either rudis, rostrata or tereticornis, or would different varieties of eucalyptus be better? Would like to have windbreak of use in supplying fence posts if possible. What is the best distance apart to plant?—Subscriber, Higley, Arizona.

The trees referred to are probably the best which can be recommended for your use. For a solid wall near the ground, of course the cypress is the best, but it must be remembered that a solid wall is not as effective as many imagine. If a tight board fence could be built on the windward side of the orchard it would not be as effective as a row of trees, this for the reason that the wind blowing over its top causes a partial vacuum on the lee side and seems to deflect or turn the force of the wind toward the ground and does more injury than where there is no such obstruction. A row of trees which restrains or stops the force of the wind serves the best purpose. In California the eucalyptus is most generally used, though eucalyptus and cypress interset is common. We have seen windbreaks of three rows of trees, two of eucalyptus and one of cypress, which were very effective. If desired for occasional cutting out of posts would recommend planting four feet apart, then cutting alternate trees would leave them practically eight feet apart. If more than the one row is set they can be alternated in the row, which will make a rather more solid break. Would prefer the rostrata, though conditions in your own section will give you a better idea as to their value, rapidity of growth and value of the posts being of course a determining factor.

Fertilizer for Alfalfa

What is the best commercial fertilizer to use on alfalfa planted on red land?—Subscriber, Reedley.

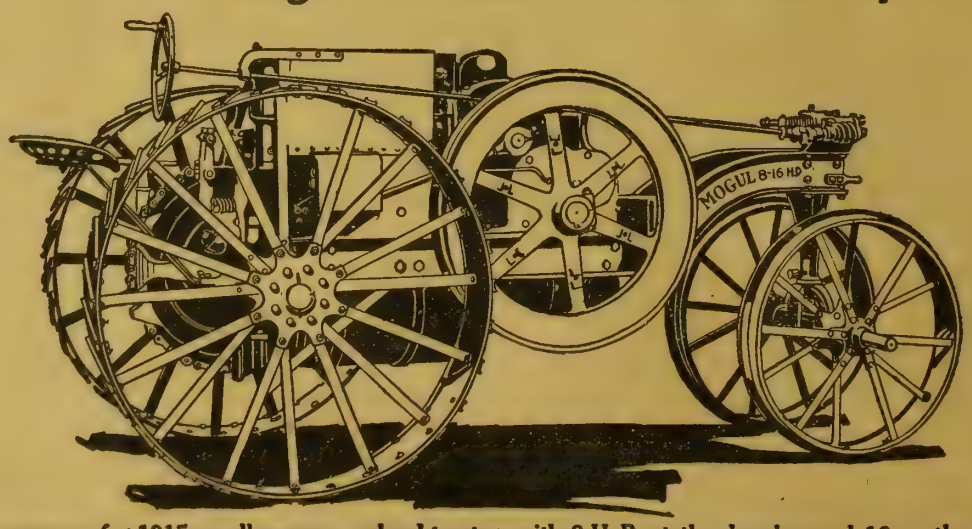
Probably the very best would be stable manure, also the most expensive and perhaps the most impossible to secure. It is said that alfalfa, if the ground is properly inoculated, secures its own nitrogen from the air. Many advise not to spend money on the most expensive of all fertilizing elements, but the application of nitrates still gives marked results on alfalfa. If one proceeded on the basis of allowing the alfalfa to secure its own nitrogen the application of fertilizer rich in phosphorus and potash, especially the former, would give good results. However, we would suggest, in a case of this kind, the making of very practical tests. Measure accurately several strips across the field, applying on one stable manure, on another rock phosphate finely ground, on another potash, and perhaps on another complete fertilizer, and in every case be sure to leave one check without fertilizer. Do not trust to the eye in making determinations as to results. Careful weighing of the production of each plant will, however, give definite information as to fertilizer required for that particular soil.

To Destroy Fertility

Will you kindly advise as to the process of fixing fertile eggs so they will not hatch?—Subscriber, Stratford.

The best way to destroy fertility is to prevent it, that is, to keep male birds out of the pen when eggs are to be sold in the market. When the male is not a stranger the eggs will usually be found to be fertile four or five days after he is returned to the pen.

Our New Year's Announcement
A Mogul Orchard Tractor for $675



We announce for 1915 an all-purpose orchard tractor, with 8-H. P. at the drawbar and 16 on the belt

An Easily Handled, Short Turning, All-Purpose Tractor

This new Mogul 8–16 tractor will do the work of eight horses in the orchard.

Being a four-wheeled, all-purpose tractor, you can use it every day.

It will do plowing and seeding as well as orchard cultivating.

It will draw manure spreaders, mowers or binders.

You can take it into a hay field to draw a wagon and hay-loader.

Any farmer can buy this new Mogul 8–16 tractor for **$675.00, cash, f. o. b. Chicago.**

The man who can use one of these Mogul tractors pays, at this price, the least for which a good, reliable, all-purpose 8–16 tractor can be sold.

If you want to use a Mogul 8–16 tractor for spring work, your order should be placed now with the I H C dealer.

Write us for full information.

International Harvester Company of America

San Francisco, Cal. Denver, Colo. Portland, Ore. — Chicago U S A — Spokane, Wash. Salt Lake City, Utah Helena, Mont.

Poultrymen have various ways of preventing the eggs from hatching when fertile eggs must be sold for the table. One is to puncture the large end of the egg which contains the air cell with a sharp needle or pin. Another is to rub the shell with a soft cloth on which a little olive oil or lard has been placed. The oil closes the pores and the embryo cannot develop. Dipping the eggs in hot water for a few seconds is a third way and affects the appearance of the egg rather less than the other methods.—J. A. K.

Barley on Shares

What is a fair proportion of the crop where barley is put in on shares? Does owner of land or renter buy the seed?—Subscriber, Los Angeles.

The proportion of crop to each of the interested parties is always a matter of contract, depending on what each party furnishes, the quality of the land, the cost of getting to market and various other matters. When the renter furnishes feed, seed, teams, labor, sacks and all other things necessary to produce the crop the land owner usually gets one-fourth of the crop delivered at the nearest market place. This varies until under other conditions the land owner gets two-thirds of the crop, depending on what each furnishes.—J. B. N.

Fertilizing Cantaloupes

We recently had inquiry as to fertilizer to use on cantaloupe lands near Brawley, Imperial County. The inquirer desired to use some fertilizer which would advance the season if possible. Mr. J. B. Neff of Anaheim writes that in all probability any fertilizer which will stimulate plant growth will retard the season rather than advance it. The question was referred to Prof. C. B. Lipman of the state university, and he answers:

"It is a little difficult to say what a man needs in the way of commercial fertilizers without knowing what his soil is like with regard to depth, chemical composition, and particularly physical nature. Knowing what I do of the cantaloupe lands in that vicinity, however, I beg to inform you that the only commercial fertilizer which could do the land any good would be nitrogen fertilizer. Moreover, it is our experience on soils of that type that the nitrogen fertilizer which will yield the best results is one not necessarily of a high nitrogen content, but of a ready availability for that particular soil type. I should, therefore, advise the use of sulphate of ammonia at the rate of 400 to 500 pounds to the acre, or of cottonseed meal at the rate of about 800 to 1000 pounds to the acre. I can see no reason for the use of other material so far as the fertilizer end of the problem is concerned at all. You understand, of course, that alkali and bad physical condition of the soil will interfere with the crops, regardless of what other conditions may be maintained. So far as the earliness of crops is concerned, we are not justified in saying that there is a direct relationship between fertilizer application and earliness."

Old Mr. Blank, who was the guest of a gay grandniece at Newport, had watched her on her social round for a month.

One day, unexpectedly, she said to him, "Well, Uncle Dan, what do you think of it all?"

"My dear," he said, after a delicate pause, "I am constantly reminded of the sage saying of a clever Frenchman: 'Life would be quite bearable if it were not for its pleasures.'"

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Urinary Trouble

Would like to have the Cultivator tell me what is the matter with my hogs. They seem to have kidney trouble. About three years ago I started with a mixed breed of hogs and have improved them by breeding to full blood Chester White boars. My trouble is losing some of the boars. The sows are not affected. At times the boars show signs of distress in urinating. Most of them get over it but occasionally one dies. So far I have lost nine and my neighbors have lost one or two from the same trouble. The season of the year seems to have nothing to do with it as they are as liable to die at one time as another. I cut a few of them open and found around the kidneys a large sack full of water. I could not detect anything much wrong with the kidneys; they had a dark blue color and did not seem to be swollen. When dead they lie on the stomach with the feet stretched out front and back. Those that died weighed between 75 and 200 pounds and while on alfalfa pasture, except one that died in the fattening pen. They have well settled drinking water from the Colorado River.—Subscriber, Brawley.

While we have not seen much of this trouble it is evident that it is caused by the lime and other elements that are in the drinking water. We have asked the state experiment station about it and they are of this opinion also. The reason for the sows not being affected is because their anatomy is different; it allows them to discharge the lime more freely. Had you examined them more carefully you would probably have found calculi (gravel) in the bladder or kidneys or in some of the passages leading from the kidneys to the bladder. The trouble might be still farther down in the urethra or sheath. When you see them having any distress in urinating examine the sheath and squeeze out anything that may be clogged there and syringe it out with warm water with a little borax in it. By giving them each a teaspoon of bicarbonate of soda in the feed or drinking water occasionally it will keep the lime that is in the system in solution and it will pass off without clogging the passages and distressing them.

Blood Poison

In August a lump about the size of one's first came on the right side of heifer's face about half way between the eye and nostril. In a few days the swelling extended to the lower jaw, lip and tongue until all were swollen hard. It also continued down the neck to the front legs and the swelling was three or four inches thick. Thinking it might be due to a foxtail I waited developments. At last I found a soft place on her face and one on the neck about ten inches from the front leg and opened them. They contained a very thick, offensive smelling matter. She was in fine condition when the lump first appeared but lost flesh until quite thin. The swelling all disappeared and she seemed much improved, but then more lumps commenced to come on the lower jaw and neck where it is joined to the head. I have opened these and they contain sometimes as much as a quart of thin, black, offensive, watery substance. By the time one heals another comes. She has a good appetite and is due to be fresh in about three months. What is the trouble? Is it contagious? Can it be cured? Is it advisable to keep her with the rest of the cattle or by herself?—Subscriber, Earlimart.

It is a form of blood poison that seems to be local. It might have been caused by the puncture of a nail or anything that would break the skin and introduce the poison. It probably is not contagious but might be infectious if some of the discharge from one of the lumps was introduced into a wound on another animal. Do not know whether it can be cured or not. Try putting on a poultice made of coarse bran and hot vinegar or soak cloths with hot vinegar and bind them on for 24 hours. When an abscess appears open it and wash out the cavity with warm water contain-

ing a little carbolic caid. Then wet the inside of the cavity with a solution of permanganate of potash, one dram to the quart of water. Repeat this once a day until healed.

Wire Cut

Two-year-old Percheron mare was cut by pawing over the lower barb wire of a fence and dragging her foot along the wire about 100 feet. This cut was between the ankle and foot on the inside. Two pieces of bone worked out. A veterinarian prescribed and treated her. The wound healed, leaving a large stiff joint and a tender spot which is easily irritated by anything, and a poor hoof. This happened three years ago. In the last few months screw worms have made frequent attacks on the tender spot and the treatment has been sheep dip and crude oil. The hoof has been cracked on the inner side for at least a year and she has been shod with a brace shoe. Recently she was trotted pretty hard on the road a few times and became lame. Then the parts above the hoof softened and broke. This was treated by dusting it with sulphate of zinc and keeping it clean. The swelling extends entirely around the hoof and reaches above the ankle. Small lumps can be felt on the bone and white gristle shows in the lower part of the abscess.—Subscriber, Laveen, Arizona.

The wire cut off the nerve that went to that side of the foot and that half of the foot is practically dead. The tender spot that seems to be so easily irritated is where the end of the nerve comes to the surface and is only partly covered by the new growth of flesh. The bone being injured so badly has probably caused anchylosis of the joint. The abscess or quittor that has recently formed will be hard to heal on account of the nerve being cut. The foot will never get right and she will not be fit for hard work but you may be able to make her pay for the keeping by using her for a brood mare. Treat the screw worms by wetting a cloth with gasoline or distillate and binding it on loosely for a short time.

Paralysis

I have a yearling colt that was playing in the pasture when something happened to him. I found him down and unable to rise. He was perspiring freely and seemed to have no control of his limbs. Have him in a sling but the sling is not tight. He eats and drinks well and seems to feel fine, but once in a while he loses his balance. What is the malady and will he get well?—Subscriber, Visalia.

Probably the colt got a hard fall and strained his back. Possibly he partially dislocated some joint in the spine. You are doing right with him. Keep him in the sling for a while and make him as comfortable as possible. When you think best give him a box stall with plenty of bedding in it and let him lie down. You may need to help him up a few times. If you can find just where the trouble is by feeling along the spine with the fingers it would be good to apply a good liniment. He will probably recover all right and be as good as ever.

Grease Heel

Have a seven-year-old mare that has been cut by wire on the hind leg between the hoof and fetlock. It has never healed properly. The leg is swollen about twice its size up to the hock. There is a continual dropping of a watery fluid from above the fetlock and the water has a peculiar odor. She is in fair condition and there is no lameness or fever. Appetite is good and she has plenty of life. Can the swelling be reduced and the leg cured?—Subscriber, Visalia.

We think it can be cured. Give internally sulphate of iron two ounces, nux vomica two ounces, powdered gentian six ounces and nitrate of potash six ounces. Mix and divide into 16 powders. Give one in the feed every night.

Observe the following directions carefully for the external treatment. Wash the leg but once, using hot water with enough lye in it to smart the hands a little. Rub dry and wrap the leg with cotton batten and put on a bandage over the cotton. Leave it on 24 hours. Then use the following lotion: Chloride of zinc two ounces and water one gallon. Every evening warm about a pint of the lotion and use it to bathe the leg, then put on the cotton and bandage; not too tight. Next morning remove the bandage and rub and brush the limb for 15 minutes. Repeat this every day as long as you think it needs it. Warm the lotion in an earthen or granite dish but not in metal.

Rheumatism

One of my mares seems to be stiff all over. When she starts to walk she humps up and seems to try to get all four feet on the same spot. Only takes a few steps at a time but after driving her a short distance she is all right. After stopping a few minutes she starts again the same way. When she walks she has her head down almost to the ground and spreads her back feet apart about 24 inches. She is in good condition. She is fed oat hay but no grain. Have not worked her in the field on account of the stiffness. There is no soreness in her feet.—Subscriber, Creston.

It must be rheumatism of the muscles of the shoulders and front legs. It may also affect the muscles of the back and loins. Keep her dry and warm and give the following powders: Salicylate of soda, bicarbonate of soda, nitrate of potash and farina, of each four ounces. Mix and divide into 20 powders. Give two powders a day for five days, then one a day while they last. Rubbing and bathing the muscles with a mild liniment will also help. This is a good liniment for such cases. Spirits of turpentine, spirits of camphor, tincture of capsicum, oil origanum, aqua ammonia and alcohol; of each two ounces and add enough water to make one quart. Shake and apply once or twice a day.

Pig With Cough

Will you kindly tell me what to do for a pig four months old which has a cold and cough? Has had it for a month or more.—Subscriber, Santa Rosa.

It is an uncommon thing for a hog to have a cold. A cough is usually a symptom of some other trouble. It may be a light case of cholera. Give him the following tonic: Four ounces of charcoal, one ounce of sulphate of iron and two ounces of powdered gentian. Mix and give a tablespoon in the feed once a day.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Contract

Is a contract for sale of land voidable if not signed before a notary? Would changes made in a contract, if mutually agreed upon, render the contract invalid?—Subscriber, Salida.

The requirement for execution before a notary is merely to render the instrument better evidence and entitle it to be recorded. Any contract may be changed by mutual consent of parties thereto.

Water Right

I am furnishing water to a pasture adjoining mine. After how many years could I be held to the water right? Water comes from flowing well. I have had place about one year. Party owning place before me let him have water one or two years at the time the well was flowing; it didn't flow all the year round.—Subscriber.

The period under which a person may acquire title by adverse possession in this state is five years, but it does not appear from the statement that anyone would acquire any rights whatever the length of time.

Division of Property

A dies leaving his property, mostly real, by will to be divided equally among his widow and children. Several of the children are minors. Can the real property be divided by mutual consent before the minors become of age?—Subscriber, Fresno.

In case of a will probate is necessary and the court would make the division of the property in accordance with the provisions of the will. Upon good cause being shown and there being guardians appointed for the minors, the court might be able to divide the property. It would, however, depend entirely upon the provisions of the will.

Mineral Claim

If A has made a desert land entry on a piece of government land, can B afterwards locate a mineral claim on the same and drill a well for purpose of discovering mineral when the mineral deposit is supposed to be below the surface?—Subscriber, Muroc.

The desert land laws expressly except mineral lands from entry. Up to the time of patent issued by the government a mineral application for any land taken under desert act may be made, in which case upon protest filed with the land department a hearing is ordered to determine the true character of the land by the United States land office. Until such decision is made as to the mineral character of the land the mineral claimant would not be entitled to enter upon the land to bore any well in order to make a discovery of petroleum beneath the surface. In order to establish a mineral location there must be an actual discovery. There must be under the laws of this state in order to hold a mineral location a discovery of oil within the limits of the claim and it is necessary to make a showing that oil is actually upon the land before the mineral claimant can be considered as other than a trespasser as against the agricultural claimant unless the mineral land claimant has obtained the decision of the land office by establishing the character of the land as mineral. In order to obtain this decision, it is usually necessary to prove that the land is more valuable for mineral than for agricultural purposes.

NO WONDER

The jack of all trades during all ages has been the butt of the satirist. The following story illustrates the fatal propensity to cover too much ground at the same time:

Little Willie's father presented him upon occasion with a pet chameleon—one of those diplomatic little animals that change their color as the occasion may require. Willie was very much interested in his pet for several days until one evening his father noticed that he was sitting alone with a faraway look in his eyes.

"Well, Willie," said his father, "what did you do with the chameleon?"

"He is gone, father—forever."

"Gone?"

"Yes, I tried to play a new game with him."

"What kind of a game, Willie?"

"Well, I put him on a blue and he turned blue. I put him on a green and he turned green. I put him on a red and he turned red, and then—"

"What happened then, Willie?"

"I put him on a plaid and he busted himself trying to make good."

In shipping live poultry crates should be used that are not too small, so the stock will not be received in a cramped and bad condition.

FATHER COYOTE

By George Sterling

At twilight time, when the lamps are lit,
Father coyote comes to sit
At the chapparal's edge, on the mountain side—
Comes to listen and to deride
The rancher's hound and the rancher's son,
The passer-by and everyone.
And we pause at milking time to hear
His reckless carolling, shrill and clear—
His terse and swift and valorous troll,
Ribald, rollicking, scornful, droll.
As one might sing in coyotedom:
"Yo ho ho and a bottle of rum!"

Yet well I wot there is little ease
Where the turkeys roost in the almond trees,
But mute forebodings, canny and grim,
As they shift and shiver along the limb.
And the dog flings back an answer brief
(Curse o' the honest man on the thief),
And the cat, till now intent to rove,
Stalks to her lair by the kitchen stove;
Not that she fears the rogue on the hill;
But—no mice remain, and—the night is chill.
And now, like a watchman of the skies,
Whose glance to a thousand valleys flies,
The moon glares over the granite ledge—
Pared a slice on its upper edge.
And father coyote waits no more,
Knowing that down on the valley floor,
In a sandy nook, all cool and white,
The rabbits play and the rabbits fight,
Flopping, nimble, skurrying,
Careless now with the surge of spring . . .
Furry lover, alack! alas!
Skims your fate o'er the moonlit grass!

FAIRY TALES OF CALIFORNIA INDIANS

WHY not American fairy tales for American children?

German children read in Grimm's Fairy Tales of water nixies in their own Rhine, of gnomes and wood folk in their own Black Forest; English children, of their own English Puck and Robin Hood; Italian children encounter in the pages of the Pentamerone the ogres of Calabria and the fairy princesses of Sicily. Why should not American children read about Coyote and Grizzly Bear, those famous heroes of native California myth?

A new world of fantastic native legend and miraculous adventure is being revealed by the University of California in the myths it is rescuing among the fast vanishing Indian tribes of California. These are being given to the world as one feature of a monumental series, "The University of California Publications in American Archaeology and Ethnology," of which 10 bulky volumes have been published during the past dozen years.

Some day these sands of native story will be sifted and the magic touch of genius will turn into pure gold, for the delight of all the children of men, California's own rich gift to the world store of myth and legend.

Here are some bits of primitive California folklore, paraphrased from Professor Pliny Earle Goddard's texts. (He took them down in phonetic writing from the lips of Old Tom Hill, an aged Chilula Indian of the Bald Hills of Northern California, or from the wife of Molasses, a very old woman who spoke the Hupa dialect of upper Redwood Creek. These tales and "medicine" rigamaroles—used for love-charms, healing, or for luck in hunting—have just been published by the University of California in the original language, and also in translation, in a volume by Professor Goddard of New York, who is now of the staff of the American Museum of Natural History, entitled "Chilula Texts."

The Monster With Two Heads

The oldest and wisest of four brothers went down the creek. As he walked along he heard something making a noise on the hillside and he saw small branches dropping from the redwood trees. Then a two-headed monster appeared. It gave chase. He ran until he was almost dead for want of breath. Finally his breath was gone—he died. The monster which had killed him carried the body across the creek and up the hill to the house of Those Who Eat People—a house so covered with moss no one would noticed it.

A day passed, and another. Worried, another of the four brothers set out. When he came to the place where the village used to be he heard something making a noise. It was the two-headed monster going along, and he made a noise in the forest like the blowing of the wind. The monster killed the second brother and carried him up the hill. Now two of them were gone.

Worried because those who had gone forth did not return, still another brother set out toward the north.

Now three were gone, and there was only one left. He was the youngest brother, and only so high. He said to his grandfather:

"Today I'm going visiting."

"My grandchild, why do you say that! They'll eat us all up!"

Then she put a belt on the youngest brother. It was this wide!

"When you're about to lose your breath, point with this belt," she told him.

Then the youngest started out.

Across the stream, up on the hillside, the redwoods were moving back and forth. It was the two-headed monster, and the monster chased him until his breath was nearly gone. He was about to be killed. But he pointed the belt. The monster fell in pieces—dead.

Then the youngest brother followed a track up the hillside. Near the head of the canyon stood a house on which ferns were growing. He went in. There sat an old woman and a boy.

"What made that noise?" said the boy. (Beside him lay a net made to catch people, for they lived on human beings, and the hillside was white with bones.)

The boy took up his net. But the youngest brother pointed his belt at him and the boy fell into two parts.

The old woman seized the net. The youngest brother pointed the belt at her. She died.

"People shan't do this way!" said the youngest brother. "They must live right! They shan't eat people!"

So he burned down the house and went home to his grandmother, and after that they lived well.

The Old Made Young

Here is a California legend told by

Boy Today
Man Tomorrow

The health of the growing boy depends upon the food you give him. See that he drinks Ghirardelli's Ground Chocolate. He'll like it and it will do him lots of good. It is a real health food and drink and costs no more than those beverages that are universally considered to be harmful. Begin serving Ghirardelli's tomorrow. It will please every member of the family.

In hermetically sealed cans.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day

D. GHIRARDELLI CO.
Since 1852 San Francisco

Despite the European war there is no raise in prices.

the wife of Molasses—an old, old Hupa woman—and from her withered lips it had an added wistfulness:

"He-who-came-down-for-the-world came walking from the north. He came to the Middle of the World. He came where the hill stands which point toward the sky. He made hills stand up on either side. There used to be one that stood up.

"People used to go up this hill and become young again. When one who is old like me went up this hill toward the east he became young again. It used to be that way.

"Then one who lives in the south said, 'This hill shall be mine only!' for he didn't like it that those who climbed the hill should be young again.

"But it used to be that way!"

Invulnerable Grizzly Bear

Panther lived with his brothers. He used to spend all his time hunting, but every time before he set out he used to say to his brothers, "You must not go to the top of the west ridge!"

One day the brothers said to each other, "Why does he always tell us that!"

Up on the ridge they saw, away off at the end of the timber, an old man lying with his legs crossed and his wife sitting beside him.

"Old man!" they shouted, "Come over and help us pound!"

"What did you say?" asked the old man.

"Come help us pound!"

"All right," he said. And he put on his grizzly-bear-skin blanket.

The two boys ran home and slid to the door of the house. They heard him coming.

"Boys, open the door for me!" he called. When they didn't open, he climbed up on the roof and came down the smokehole. The boys gave him some venison and he ate it. When he had finished it they gave him another helping, and he ate that—he ate all the meat in the house—he ate the untanned hides. When he had finished everything he said, "Well, I'll go home!"

The boys opened the door but he was so filled he couldn't get through, so he climbed out the smokehole.

When Panther, the oldest brother, came home he carried two deer.

"Didn't I tell you not to go up on the west ridge?" he said to his brothers, and he slapped them and pinched their faces.

All that night Panther was busy flaking arrow points. In the morning he set out, carrying five quivers full of arrows. He came where the old man was lying and he shot him twice.

"Alo!" the old man cried; "what did you put in the fire that snaps so?"

"It's not the fire snapping this time," said the old woman. "He's shooting at you!"

Then the old man jumped up and took down the grizzly-bear blanket and put it on. The young man kept shooting back at him as he ran. Finally Panther had only one arrow left from his five quivers full.

"Between his toes!" called the old woman.

Panther shot him there between his toes, and the old man rolled over dead.

The Bewitched Maiden

Two men lived with their sister across the creek from Littcuwhwinnauwdin. Once upon a time an old man came from the west and said, "You'd better bring some acorns across the mountains to me." They loved their sister very much, but they concluded they would go and carry loads of acorns across to the coast. However, they warned their sister not to leave any acorns outside the house.

They set out toward the west with their loads. They went into the forest, they went up the ridge, they crossed the creek, they came to the ocean, and then they reached the house of the man who had asked them to bring acorns. There they sat down by his door.

"Come in!" someone called. When they had finished eating supper the old man said, "Well, let's go to the sweathouse." They went into the sweathouse and lay down close to each other. The old man got up. "Are you asleep?" he asked. They made no answer. When he kept on asking they knew what he was about to do—at dawn he was going to kill them by magic. So the strangers moved the old man's sons and lay in their places. The old man felt about and rubbed something in the mouths of those he supposed to be his visitors. About dawn there was a noise in the sons' throats. It was the black fluuid in their throats that made the noise. Then the old man found what he had done.

"You had no good intentions when you asked us to bring you loads of acorns," said the wise brother to the old man.

The old man replied that if he would not tell what he had done, he would give him a woman and a gift of red obsidians. The brothers refused, but made up the loads of surf fish and seaweed which had been given them in return for the acorns, with mortars in the middle of the pack.

"Well, let's go back," said one of the brothers. They started back, but as they were going up the ridge they heard that the old man's sons had died from the magic he had intended for the brothers.

The brothers went along until the sun was in the west and they had come to the place where they had intended to camp, but fearing that their sister might leave acorns outside the house, they went on.

The old man was walking after them, vainly trying to overtake them. They heard him coming. One of the brothers told the other to sit down below the trail. He himself crouched above the trail with a knife in his hand. When the old man came to a log over which he had to climb one of the brothers jumped up and stabbed him. The other caught hold of the old man and stabbed him repeatedly. Then they cut him to pieces.

So they came back from the west, and it was warm weather as they passed along. As they came along the ridge on their way home, nearly overcome with the heat, they heard a noise in the direction of their village. Their sister, for whom they had hurried back, lay dead—she had been killed by magic poison the night before, as she was bringing in acorns.

But they did not feel so badly, for they had already cut in pieces the old man who had caused her death.

A RELAPSE

Into a general store of a town in Arkansas there recently came a darkey complaining that a ham which he had purchased there was not good.

"The ham is all right, Zeph," insisted the storekeeper.

"No, it ain't, boss," insisted the negro. "Dat ham's shore bad!"

"How can that be," continued the storekeeper, "when it was cured only last week?"

The darkey scratched his head reflectively and finally suggested:

"Den mebbe it's had a relapse."

IDEAS FOR THE COOK

Written for California Cultivator
By Isabel Cottle

Breakfast

Porridge with Dates Cream
Hot Bacon Sandwich Fried Bananas
Crullers Coffee

Lunch or Supper

Cream of Spinach Soup
Escalloped Macaroni and Minced Clams
Asparagus Salad Warm Rolls
Cookies Tea

Dinner

Hamburger Steak, Seasoned with Paprika and Caraway Seeds
Rice Cheese Dressing
Creamed Turnips Chopped Pickle
Baked Indian Pudding, Cream
Coffee

Bacon Sandwich

Toast thin slices of bread. Butter and place between them crisp slices of bacon. Serve piping hot.

Fried Bananas

Slice bananas crosswise and sprinkle lightly with flour. Place a lump of butter in skillet over a moderate fire. Put in bananas and stir as little as possible to keep from burning. When thoroughly heated through remove to hot dish, sprinkling over a few drops of lemon juice, dust with powdered sugar, and serve.

Escalloped Maraconi

Boil macaroni until tender, drain and rinse in cold water. When well drained season with salt, place in baking pan and pour over part or all of the contents of a can of minced clams, according to quantity of macaroni. Cover top with cracker crumbs, dot with butter, and cook in oven until nicely browned.

Hamburger Steak

Grind two pounds of round steak and a generous piece of suet, using medium grinder and discarding gristle and stringy portions. Season with salt, two-thirds of a teaspoon of paprica and half a teaspoon of caraway seeds. Then add one-half cup sweet milk. Form into cakes, flour and fry.

BIRD SANCTUARY AT SEA

Mrs. Ada Cambridge, the English novelist, describes in the following beautiful verses the sad destruction of birds lured, during the dark nights of the migratory season, to the lighthouse lamps:

Confused, dismayed, they flutter in the gale,
Those little pinions that have lost their track;
The gallant hearts that sped them reel and fail
Like ships aback.

Sucked in a magic current, like a leaf
Torn from autumnal trees, they drift abroad,
But ever nearer to the siren reef,
The ruthless sword.

On, on, transfixt and swooning, without check,
To the lee shore of that bedazzling wall,
Until they strike, and break in utter wreck,
And founder all.

Brave little wings, that sailed the storm so well,
Trimmed to the set of every wayward blast!
Brave little hearts, that never storm could quell,
Beaten at last!

The great sea swallows them, and they are gone,
Forever gone, like bubbles of the foam;
And the bright star that lured them, shining on,
Still points to home.

It is a pathetic fact, broad in its appeal, that the beacon which guides the storm-tossed sailor safely to the haven where he would be, should be the cause of the merciless death, each year, of thousands of helpless birds, bound upon long, mysterious journeys under darkened skies.

For years it has been thought that the birds, hypnotized by the light, dashed themselves against it, to their death. Mr. Thijsse, however (a Dutch naturalist), has learned from three years' experimenting, that the birds are seeking a resting place, as they fly round and round the baffling light, and those who fall to die within the lighthouse gallery, or the sea below, have fallen from sheer exhaustion.

Working under the supervision of Mr. Thijsse, and by permission of the authorities of Trinity House, the Royal Society for the Protection of Birds, less than two years ago erected perches for birds on the lighthouses of St. Catherine's in the Isle of Wight and the Casquets off Alderney.

Mr. Thijsse's experiments at the Great Terschelling Light showed that the loss of bird life there had thus been reduced from thousands in a night to something like a hundred during the entire migration season. The reports of the English lighthouse keepers to the Council are, practically, to the same effect.

"Thousands of birds," say these reports, "instead of fluttering on weary wing around the baffling light, discovered the long line upon line of perches, and crowded upon them. . . thousands of little birds, huddled together thickly, birds of many species and varying sizes, but all alike in their strange passion to reach their native place." "It was," said one witness, "the most wonderful sight I have ever seen in my life."

The installation of bird perches at a lighthouse, according to the report of the English Society, costs from $300 to $500, running expenses averaging about $50 to $75 per year.

The Royal Society for the Protection of Birds is planning to make bird sanctuaries at all lighthouses where the destruction of birds has been most noted, thus changing these death-luring lights into havens of safety and rest.—Our Dumb Animals.

ON LETTER WRITING

Most of us, in time, answer business letters and invitations to dinner, but to our friends, unless we want something, we seldom write. If, when the inspiration seizes us, we do not at once "take our pen in hand," we are likely to put off writing every time the thought of it occurs to us.

Sometimes we cannot think of a happy way of phrasing what we have to say; and we are afraid we may say the wrong or the awkward thing. It may be selfishness that holds us back from expressing our thanks, or our congratulations, or our condolence to our friends, and so the letter remains unwritten. Sometimes it is ignorance or inexperience; we do not realize that the conventions of society require that we should make some acknowledgement to our friends of favors and kindnesses received, just as we are expected to call after we have been to a dinner party.

Nothing brings more pleasure than an unexpected personal letter, or a gracious note of thanks; a pleasant greeting on a friend's birthday, a comforting word in time of sorrow, a line of congratulation when one has met with happiness or good fortune, a graceful note of appreciation of little courtesies—any one of these takes but a few moments, and there is no reason why we should not all write such letters oftener.

Letters should be timely. Christmas letters should not be delayed until nearly Easter; nor letters of congratulation until the memory of the pleasant event has grown dim. Everyone likes to feel that his friends have thought of him at the time of his success, or his joy, or his sorrow. Besides, if you do not write when the thought is fresh, the letter may perhaps never be written.

Even from a purely selfish point of view, it would be a good thing to learn and parctice the art of the graceful note. There are few things that bring one surer favor, or that give one better standing with one's friends than a reputation for thoughtfulness in letter writing. It is an art one can cultivate, and a habit one can acquire. It is well to begin practicing early.—Youths Companion.

ARE YOU ORGANIZED?

There are definite ends you wish to accomplish. Your ambition has a goal. Are your forces organized for achievement, or are you zig-zagging with events?

Mark a straight line to your goal. Your plan calls for money. Get it the surest way—**a savings account at the Security and a resolve to keep it growing.** Make no truce with trifling inclinations. The mastery of your small coin gives you command of large possibilities.

Organize your living and your spending. Make that account of yours at the Security the object of your constant consideration. Then you will be, of a certainty, traveling successward.

Citrus Fruit Market

LOS ANGELES, Jan. 13, 1915.

From present indications shrewdest observers have decided that the coming season offers no promise of exceptionally large returns. California stock was never finer and the quantity is not excessive, but general trade conditions do not offer opportunity for ready sales except at comparatively low prices. The frozen stock caught in the eastern blizzards has been nearly all cleaned up. The southern end of the state is beginning shipping and this is being well received.

Lemons were some of them caught in the freeze and these have sold at almost any price which could be secured. Shipments are again going forward and these are commanding only fair prices.

Shipments

Shipments or oranges to date from Southern California since Nov. 1, 1914, 1351 cars, lemons 563, total 1914. To same date last season, oranges 2051, lemons 289, total 2340. From Tulare County, oranges 4913 cars, lemons 88, total 5001. Last season, oranges 3937, lemons 23, total 3960. From northern counties, oranges 470, last year, same date, 365.

NEW YORK, Jan. 11.—Twenty-three cars navels, one Arizona navels, two cars California lemons sold. Market is unchanged on both oranges and lemons. Cloudy.

NAVELS—	Avg.
Maljan Blue	$1.35

If your woodwork is finished in the natural wood and needs varnishing to brighten it up, it must be thoroughly cleaned before applying the varnish. Remember, varnish does not cover spots or soiled places like paint, but mirrors everything through, making it more noticeable than before. There is no objection to using soap for this purpose, providing it is carefully washed off with pure water and dried before applying the varnish. To get the best results the old varnish should be lightly sandpapered after it is cleaned and dried, before applying the new coat. About No. 1 sandpaper is right for this purpose. The work of the sanding.

In painting implements it is usually more convenient to take them apart and hang the separate parts where it is easy to get all around them. If there are several wagons to be painted it will save a good deal of labor to set an old axle or spindle so that they can be placed on it, allowing the painter to stand erect and turn the wheel instead of climbing around it.

For most of the farm buildings, whitewash may be used and made to serve a double purpose. The disinfectant may be mixed with the wash and it will not only give the interior a clean, sparkling appearance, but will also destroy any infection which might remain.

The uses for paint on the farm are many and varied. Not only does the timely use of paint keep the farm buildings in good condition, but at the same time it adds to the appearance of the buildings at least 50 per cent.

Direct selling by parcels post will make slow progress unless the farmers are willing to divide the middleman's profits with the consumers. City people will not buy direct unless they can save money by so doing.

A careful man will use only the best seed that is adapted to his locality. Good seed is a necessity, but no seed can give satisfactory results unless it receives good cultivation.

HOW OLD IS ANN?

They tell the story of a Florida grower who allowed a commission handler to sell his grapefruit. The commission man reported that the car sold at $14 less than the cost of handling, and asked that this amount be remitted. Said the grower to a friend of his: "I suppose I will have to send him a check to cover?" "No," said the friend, "why not send him $14 worth of grapefruit?"

The question is, and it parallels the one of "How old is Ann?" How much grapefruit would be $14 worth if one car was worth $14 less than nothing? Figure it out.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅝c per gallon, cost one-third of a cent per H.P. per hour to operate.

All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built leng life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

Before you buy an engine send for our catalogue—free to all who write for a copy.

Reasons Why-

You Should Install the Layne & Bowler Pump

THE ideal pump you want must meet the conditions of your well perfectly. It must develop water at the very lowest cost and with the absence of pump troubles. Furthermore, it must continue giving this high standard of service year in and year out. You cannot go amiss by installing the **Layne & Bowler Pump.** It has more than demonstrated its efficiency, durability and economy.

Prepare now for the irrigation season.
Write for our Free Catalog No. 30.
It gives full details.

Layne & Bowler Corporation

900-910 Santa Fe Ave. LOS ANGELES

"Jackson MADE"

The greatest test of any pump is its ability to raise the maximum amount at lowest cost per gallon, day in and day out, year after year.

True pumping economy is one of the great features of "Jackson Made" pumps; they work economically and their freedom from repairs and power saving pays their original cost in a few months.

If your pumping puzzles you, tell us—our expert engineers are at your service free of charge.

Write for Catalog No. 48A

A Better Make Not Made

"Jackson Made" pumps are manufactured in various styles to do your particular work at lowest possible cost.

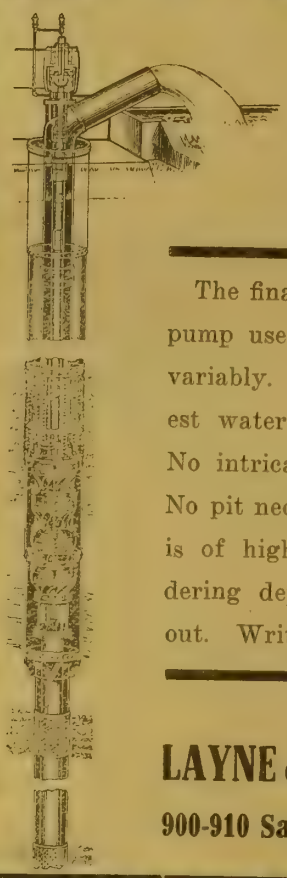
BE PREPARED BY INSTALLING THE

LAYNE & BOWLER PUMP

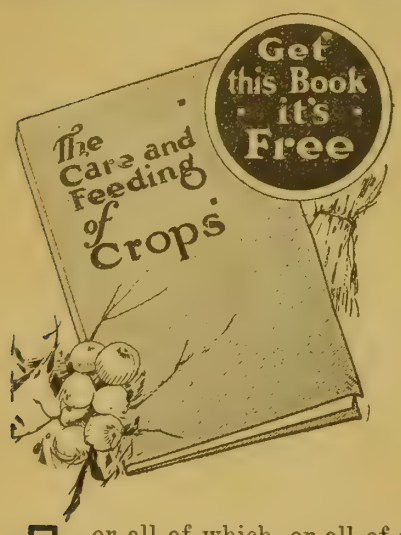


"Let the World's Largest Water Developers Solve Your Pumping Problems."

The final choice of the modern irrigator and pump used is the **Layne & Bowler Pump** invariably. It will positively produce the cheapest water and with the absence of trouble. No intricate mechanism to get out of order. No pit necessary. The **Layne & Bowler Pump** is of high efficiency—durable, compact—rendering dependable service year in and year out. Write for Catalog No. 30.

LAYNE & BOWLER CORPORATION

900-910 Santa Fe Ave., Los Angeles, Cal.



Your Crop Limitations

Your crop yield will be limited by one particular plant food element which may be deficient in the soil. You may know that such conditions as temperature, lack of moisture, excess of moisture, poor drainage, alkali or acid conditions and soil texture, as well as poor cultural methods such as lack or excess of pruning and imperfect cultivation, any or all of which, or all of them, will limit your crop.

But there is still another big factor which is being taken into consideration by the progressive farmer and orchardist.

It is soil fertility.

Soil fertility depends upon the supply of available plant food. Notice, particularly, the word "available."

And when we talk about plant food we are talking about six important factors or food elements which make up an available plant food.

These are only a few important thoughts necessary for any orchardist or farmer to get the most out of his land.

There are a great many other thoughts which are as important and as valuable to you.

SEND FOR THIS FREE BOOK

It contains 64 pages of vital facts — information condensed into this simple form which is ordinarily contained in two and three volumes on the subject; and all condensed so that you can get the information readily and easily.

Remember that if you get this book any questions that you would like to ask about soil fertility will be gladly answered by our experts free of charge. And it doesn't make any difference whether you write one or a dozen letters for this information.

Write today—because you might forget it if you put it off.

Pumpkins and Pie Melons

Analysis of Food Values Shows Real Value of These Foods and Comment Thereon is Made for Cultivator Readers by Dr. Leroy Anderson

BULLETIN No. 132 of the California agricultural experiment station contains, among other good things, the analyses of various foods for various animals. I will quote a few to show the comparison in food value between pumpkins and other well known and used feeds, especially for the dairy:

Feed Stuffs	Pounds Dry Matter in 100 lbs.	Pounds of Digestible —Nutrients in 100 lbs.— Protein	Carbo-hydrates	Fat	Nutritive Ratio
Green alfalfa	20.0	3.7	7.3	0.6	1:2.3
Green sorghum	20.6	0.6	12.2	0.4	1:21.8
Corn silage	24.6	1.3	13.5	0.6	1:11.7
Beets, mangels	9.1	1.1	5.4	0.1	1:5.1
Pumpkins, Connecticut field	9.1	1.0	5.8	0.3	1:6.6
Pie melons	5.5	0.7	3.3	0.2	1:5.4

Of the above foods, pie melons are of least value, pound for pound of green weight. I take it that this is the melon that is sometimes called citron melon. But the dry matter contained therein is equal to the same amount of dry matter in beets or corn silage. The chief difference is that the cow must eat more water in pie melons than in corn silage to get the same nourishment. In feeding trials with pumpkins (which I presume were the yellow Connecticut field pumpkin) the Vermont agricultural experiment station in 1908 found that two and one-half tons of pumpkins are equal to one ton of corn silage for producing milk. The cows eating pumpkins produced 5 per cent more to the unit of dry matter than the cows eating corn silage. The quality of the milk was not changed by feeding pumpkins.

Turning to the table at the head of this article, the reader will notice that the amount of dry matter in corn silage is 2.7 times that in pumpkins. If we then take the amount of dry matter in the feeds as a basis of judgment we find pumpkins doing a little better in the Vermont trial than they would be expected to do according to dry matter content. But approximately they show up in actual tests as good, pound for pound of dry matter, as corn silage. This is my basis for the statement above that pie melons may be considered on the same basis. They may be better than sorghum according to dry matter, because sorghum is much lower proportionately in protein and high in carbohydrates (sugar). They may not be so good as alfalfa according to dry matter, because alfalfa is very high in protein and relatively low in carbohydrates.

As to the seeds, feed them also. The Vermont trials were with seeds fed. Professor Henry says, "There is a tradition among farmers that pumpkin seeds increase the kidney excretions and should be removed before feeding. The United States Dispensatory states that the pumpkin seed is a vermifuge, with no reference to any other property. The seeds contain much nutriment and should not be wasted."

On the basis of dry matter one pound of pumpkin is equal to nearly two pounds of pie melons. The latter must therefore produce twice the tonnage per acre to be as profitable to grow as pumpkins. This may be said, however: that the melons seem to thrive better on light sandy soil than pumpkins. This is the strong point with melons and renders them available on soil where other crops may not be profitable. If any dairyman has such land that nothing seems to thrive on, plant pie melons. Give them a little care and they will pay for it. In this state of California too many dairymen are prone to rely on one food—alfalfa, for instance—and the cows need variety. On any land where it is possible plant and grow something else to give those poor cows a change of diet.

Besides furnishing actual food material, melons, pumpkins and beets have a beneficial action upon the digestion. For this reason, when the cows' ration of all hay is supplemented with one of them the increased milk yield is out of proportion to the real food content of the melon or beet. Moreover, the cow will eat more on a varied diet than on hay alone, which is what we want her to do, for then she is able to make more milk.

It is possible to overfeed with pumpkins or melons, but as to the number of pounds per day to make trouble, I am not sure. Sugar-beet pulp has about the same amount of dry matter as pumpkins—i. e., ten pounds in 100. In a feeding trial at Cornell University I fed as high as 90 pounds per day per cow and had no bad effects. I noticed that the cows eating so much beet pulp did not drink so much water as cows on silage or on hay. They naturally would not, for in 90 pounds of beet pulp there would be 81 pounds of water. In 100 pounds of pie melon there are 94.5 pounds of water and 80 to 90 pounds of water in 10 to 11 gallons—a pretty good drink for bossy to take at a sitting. Compare alfalfa hay with melons for a moment. The hay has 89.1 pounds of dry matter in 100 and melons 5.5 pounds. In other words, the cow must eat 16 pounds of melons to get as much dry matter as is in one pound of hay. I expect a large cow would stow away 100 pounds of melons in a day in two feeds and not mind it in the least. And besides that she should have from 20 to 25 pounds of alfalfa hay in order to get anywhere near a full ration. But the chances are that half as many melons would do equally well in modifying the ration, and make the bulk of it of alfalfa and other feeds. Fifty to 60 pounds per day makes a good ration of these fresh green things and if the supply is short, half the quantity will be found worth while feeding. As to relative feeding value, I would place corn silage first, pumpkins second, melons third, and grow any one or any two that my land and my purse would allow. I would not grow beets if I could possibily avoid it because they are so expensive to handle.

Notes on Unfermented Lemon Juice

Prof. W. V. Cruess Writes for Cultivator Readers of Recent Investigations Made by Him and Other University of California Investigators

A GREAT deal of work has been done by the department of agriculture and various chemists on the production of a satisfactory lemon juice, while tests have been made in the enology laboratory on clarification and sterilization of the juice. The problems presented are; preservation against mold and fermentation, production of a clear juice, and retention of flavor. We have succeeded in preventing spoilage and in getting the juice permanently bright, but the retention of all the original flavor and aroma is not satisfactorily solved so far as we are aware. However, a workable method for clearing the juice may be of interest; hence the following notes on experiments made at Berkeley this season.

Extraction of Juice

In all tests the juice was extracted by slicing the lemons thin and pressing out the juice. In this way some oil and flavoring matter from the skins are taken up by the juice. By pressing through heavy cloths most of the pulp is gotten rid of.

Addition of Finings

Spanish clay has been found to be the only clarifying agent to give consistent results. It is used most effectively at the rate of approximately 1000 grams per hectolitre or, approximately 8¼ pounds per 100 gallons, or roughly two pounds per 25 gallons, or 6¼ ounces per five gallons of juice. Different lemon juices may not require the same amount of Spanish clay, hence the desirability of making tests on small lots first.

The clay must be prepared at least a week before starting operations. It is made up by mixing the desired amount of water and letting it soak four of five days. It must then be ground to a fine mud or suspension in the water. No coarse particles should remain. A convenient concentration is to make a suspension of two pounds Spanish clay to one gallon of water. Then each pint of this suspension contains four ounces of clay or each quart contains eight ounces or one-half pound.

After adding the clay two methods of procedure are open. The cold juice may be allowed to stand 24 hours to settle; the clear juice drawn off and filtered if necessary, and the "mud" or settlings filtered separately. Suitable filtering machines may be had from any of the winery or brewery supply firms in San Francisco or Los Angeles. The filtered juice may then be bottled, corked or capped and sterilized as indicated below. Or the freshly mixed clay and juice may be heated to 140 degrees Fahrenheit left to stand 24 hours, filtered and bottled. This method seems to give more satisfactory clearing, but is more troublesome.

Capping

Information on suitable bottles and caps for same may be had from any fruit juice, brewery or soda water factory supply house. The caps must be impervious to both the juice and to air and must stand heating to 155 degrees Fahrenheit.

Sterilizing

The filled and capped bottles should

CITRUS Trees

WE LEAD all other nurseries in the growing of choice citrus stock, because we specialize in that line and have the experience to produce the best trees. We have a splendid stock and can supply all the leading varieties, but ask your special inquiry for any of the following:

ORANGES

Washington Navels and Valencias.

LEMONS

Eureka, Lisbon and Villa Franca.

POMELOS

Marsh Seedless, etc.

AVOCADOS

All the leading strains.

Our stock is grown from buds of select strain—the kind that produces premium fruit. Our nurseries are located in the choicest spots of California under ideal soil and climatic conditions. Our careful methods of packing insure trees reaching you in first class shape.

OLIVES

In addition to citrus trees, we also make a specialty of growing Manzanillo, Mission and other varieties of fine olives. Our trees are strong and thrifty—guaranteed true to name. Write for "VALUABLE BULLETIN ON THE OLIVE," which will be sent free to any address on request.

Deciduous Fruits & Ornamental Trees

We are agents for the Fancher Creek Nurseries of Fresno and carry a complete stock of their deciduous fruit and ornamental trees, plants, vines, etc. No matter what you have in mind to plant this season, we can supply you with a splendid stock of trees.

ROEDING'S FREE ADVISORY SERVICE

Our Mr. George C. Roeding has had over 30 years of practical experience in California horticulture. This experience is at the disposal of every "R. & W." customer. When you purchase trees or plants from us we advise with you free of charge, as to best methods of planting, pruning, irrigating, etc. Ask for further details.

USE THE COUPON

Fill out the coupon at bottom of this page, or attach it to your letter when writing us. We will be glad to quote you our lowest rock bottom prices on nursery stock if you will give us an idea of the varieties and kind that you wish to plant. Write us fully. Doing so puts you under no obligation.

then be sterilized. In sterilizing the bottles should be placed in water horizontally and completely covered. The water should be heated slowly until the juice in one of the bottles registers 155 degrees Fahrenheit. A suitable observation bottle may be arranged by inserting a thermometer through a plain cork and fitting it into a bottle of the juice. The juice should then be taken from the sterilizer and allowed to cool.

The above method gives a clear juice that will not mold or ferment as long as the bottle is kept closed. The principal defects of such juice are development of a "lime" flavor and darkening in color on standing, that is to say the strong fresh lemon flavor does not persist, although considerable of the lemon oil flavor does remain. The darkening takes place slowly, although it is noticeable in juice that has been kept in the laboratory six weeks, this juice having turned to a yellow color. (Professor Steubenrauch states that the color becomes more or less brown when kept a year.)

What is claimed for the method as it has so far been developed is that it gives a permanently clear juice; that it will keep against mold and yeast growth. The finished product will resemble more in flavor the commercial "lime juices" than it will fresh lemon juice. More work will be done with the object of getting a juice of more permanent flavor.

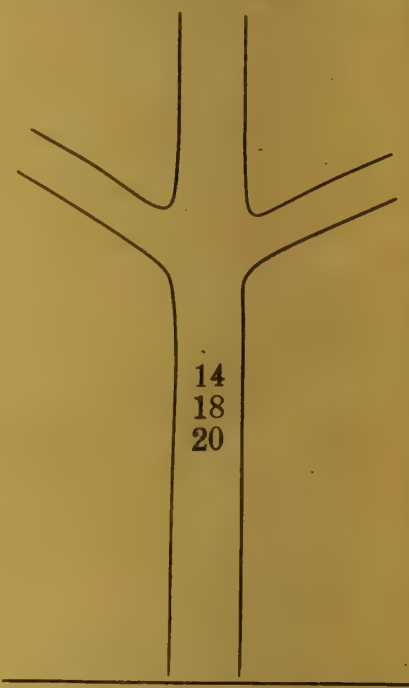
IMPROVEMENT OF FRUITS THROUGH BUD SELECTION
(Concluded)

Deciduous Investigations

Shortly after the beginning of the citrus work Mr. Shamel started some preliminary observations with peaches at South Glastonbury, Connecticut. Our plots include Carman, Elberta, J. H. Hale and Belle of Georgia. Similar variations were found as in the citrus trees, varying from absolute barrenness to very great productiveness. These differences were consistent from year to year.

Work also was started in the J. H. Hale apple orchards near Seymour, Connecticut. Because of limited time these trees were not picked, but the self-evident fact that there was a marked variation among trees of the same variety in deciduous fruits to secure more detailed information on this point. Accordingly after a survey of a number of apple orchards in Michigan by Professor H. J. Eustace of the Michigan agricultural college, and the writer this last summer, two apple bud selection study plots were located, one of Northern Spy and one of Baldwins. The same general plan was followed as in the California citrus work.

Each tree had its individual number painted on the tree trunk or large main limb with white lead paint. This number includes the plot number, row number and number of the tree in the row. Thus, No. 14-18-20 instantly located that tree as being in plot 14, row 18 and the twentieth tree from the end of the row, always numbering from a certain given point.



The fruit from each tree is picked separately and the fruit assembled at the base of the tree. The fruit is graded into first, second and third grades, and each of these grades can be further subdivided into large, medium and small. The fruit in each grade is counted and weighed and the notes recorded in special blanks.

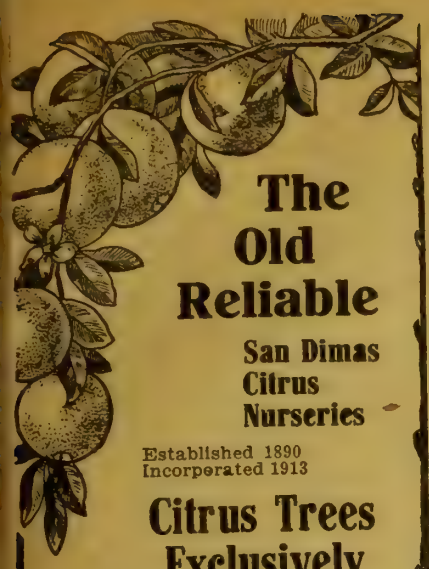
crop from each tree was estimated each year. Certain trees were found that were consistently heavy producers each year, others that bore a large crop in alternate years, and still others that were consistently poor producers each year.

It seemed worth while because of Our deciduous fruit work naturally divides itself into three parts as in the citrus work: A study of the differences as they occur among trees under the same conditions; Can these differences be propagated? Will these differences be consistent in the budded trees?



The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas
California
U. S. A.

Teague trees are started right, grown right, and shipped right.

We can already distinguish six types of Spy and six types of Baldwin trees. In most cases a difference in the habit of the tree growth is correlated with a difference in fruit.

These types in the case of the Spy are: The open productive type; the alternate bearing type; the upright unproductive type; the light foliaged type; the deeply ridged fruit productive type; the McIntosh Red type.

The open productive type of tree corresponds to our open productive lemon tree, all the branches are loaded with fruit and they bear a uniformly heavy crop each year. You may ask, "How can you tell that by one year's observation?" Partly by the old fruit scars, but more by the owner's testimony. The owner of the orchard where our plot is located knows his trees and can tell what a number of them have done in the past.

There are a number of trees on the alternate bearing type which bear a large crop every other year. While these are profitable trees they do not represent as great a financial return to the owner as the trees which bear a large crop every year.

A very common type of Spy tree in all orchards we have visited is the upright unproductive. This type of tree is a large upright one, a very light cropper and in some cases absolutely barren. Associated with this distinct habit in tree growth is a markedly ridged flattened fruit. The poorest tree of this type in our plot this year bore one bushel of these poor quality flattened ridged fruits, as compared with 38½ bushels as borne by the best tree of the productive type. (These trees I am referring to are 22 years old.) Just think what that difference means in dollars and cents—one bushel compared with 38½ bushels!

The light foliaged unproductive type shows a distinct variation in foliage, has a spreading habit of growth and bears a fruit somewhat flattened and ridged at the calyx and blossom ends.

Another type, for want of a better name, we have called the deeply ridged productive. The trees are productive and the fruits resemble a standard Spy, with the exception that they are a deep red in color and markedly ridged.

The sixth type we have called the McIntosh Red type. Probably some other name would be more appropriate. The fruits are flattened, but they have a color resembling a McIntosh.

We have found these types in other orchards; in orchards that were in sod, in orchards that were cultivated, in low-headed orchards and in high-headed orchards.

In the Baldwins we have found at least six types. Some are characterized by differences in production and others by differences in the fruits. These are:

A standard yearly productive type.

There appears to be a marked variation in the color of fruits borne by different trees of this type, varying from a brown on some trees to a deep red on others.

An alternate bearing type.

An upright barren type.

A type which bears distinctly flattened fruits.

The "York Imperial" type, bearing a fruit shaped like a York Imperial instead of a standard Baldwin.

The "Roman Stem" type, which type of fruit has a distinct protruding segment or lip in the cavity.

These types we have found occurring as limb sports, individual fruit sports and as whole trees. These are

"Behind each tree is our guarantee"

Our name and guarantee stands back of every tree leaving our nursery. We specialize on foothill grown stock for hardiness, good, well branched roots, freedom from root knot and disease. They are superior to and unequalled by those grown in any other soil or location.

TRUE TO NAME

SILVA-BERGTHOLDT CO. CALIFORNIA FRUITS

REMEMBER
When you purchase
Silva-Bergtholdt Trees
you buy from a firm who are fruit growers and shippers as well as nurserymen.
Our buds are selected for propagating only from parent trees having the best record for quality of fruit and productiveness, thus insuring a pedigreed tree.
Our years of experience, knowledge and observation in horticulture are at your service. We show you how to succeed.

Write to-day for our Fall Catalogue
giving accurate description of each variety and valuable suggestions as to tree planting.

Order now while the assortment is still fairly complete.

The best varieties are selling rapidly. Don't wait too long.

ALMONDS
Plant Almond trees for profit. California has a monopoly of the American market, which demands four times the present supply. We have an extra fine lot of trees in all the standard varieties on Bitter Almond and Peach root.

WALNUTS
Mayette—The true Wiltz strain for productiveness, freedom from blight, and quality, has no equal in any of the other standard varieties.
Franquette — The true vrooman strain, next to the Wiltz Mayette. The best Walnut for Northern and Central California. Our scions of Mayette and Franquette are absolutely of true strain, cut from selected trees.

CLINGSTONE PEACHES
California Canned Clingstones have a monopoly of the markets of the world for the reason that Eastern grown Clingstones can be canned only for pie fruit.
Tuscan — Are our improved round Tuscan; firmer; more symmetrical; more productive; not subject to windfall and split-pit and preferred by all canners to the Oblong Tuscan commonly propagated.
Phillips—We cut our buds from a block of trees that have proven of an exceptionally good strain of this variety.
Levi—A fine late Cling and desired by many growers to prolong the canning season. Very productive.

Our trees received first prize and gold medal at the State Fair.

OLIVES
Our Mission Olives are worked on Picholine root. The Picholine is a stronger growing and a deeper feeding root system than one grown from cuttings. Plant Olives only on Picholine root.

PRUNES
Prunes are a staple money maker. Our parent trees of French, Imperial, Sugar and Robe de Sargeant have been selected for quality, productiveness, and size of fruit.

PEARS
The California Bartlett monopolizes the markets of this country and Europe. The opening of the Canal route reducing the cost of their transportation East and for Export by one-half, will create a demand for the California Bartlett and California grown Fall Pears that the present planting cannot supply. We have a fine block of Bartlett, Comice, Winter Nelis, Anjou, and other varieties. Buds are cut from selected parent trees.

CHERRIES
The first and best fruit of the summer season, grown only in California during their season of ripening and more profitable even than Oranges in Riverside County. Don't miss this fruit in your planting.

APRICOTS
Apricots being another fruit grown successfully only in California. Have a monopoly of the American market, and canned and dried the export demand is unlimited. We have a fine lot of trees in the standard varieties—Royal, Blenheim, Moorpark and Tilton on Peach and Apricot root. They are selling fast.

Write to-day for our catalogue, price list and full information about planting—it's free.

the types we are familiar with now. No doubt others will be found, possibly by ourselves, and without question by others in their own orchards.

In addition to the variation in types there is a great variation in production within each type. In the Spy orchard in which we were working this year the average tree production was about four barrels per tree, while some of the best trees in our plot bore over ten barrels.

We have not had time as yet to show experimentally that these variations in deciduous fruits can be propagated. However, as we have found just as great, if not greater, variations in deciduous as in citrus fruits and as we have been able to successfully propagate these variations in types and differences in production in citrus fruits, it certainly seems a safe assumption that these differences can be propagated in deciduous fruits as well.

The J. H. Hale peach which occurs with great frequency as a limb sport on standard Elberta trees has been successfully propagated.

In the North Yakima section a sporting tree of Rome Beauty has been found. This tree bears a deep red fruit which at maturity shows none of the characteristic Rome Beauty markings. Buds have been taken from this tree and show the same characteristics in the budded trees as in the original tree.

A prominent Texas fruit grower has recognized this principle of variation in his trees and has successfully worked over unproductive types of apples, persimmons and pecans to productive types. A number of prominent nurserymen in West Virginia, New York and many other sections are propagating their nursery stock from select bearing trees and are securing uniformly productive trees, as compared with many unproductive orchards propagated by the old method of securing buds from other young trees in the nursery row.

We mention these few instances out of the many we might give of the propagation of these variations in widely scattered sections simply to show the large number of these variations and also that they have been successfully propagated. And so while we have not had time as yet for our own experimental deciduous buds to come into bearing we have already accumulated such a mass of commercial or practical evidence as will convince any sensible man not only that these variations exist in marked numbers, but also that they can be successfully propagated.

Performance Records

Now we come to that phase of the subject which probably is of most interest to the fruit grower: How may the fruit grower secure his own performance record? By performance record we mean a record of the tree's production and behavior. A very efficient and quick way of securing such records is the tree census.

At the top of the page we have a place for the variety name, source from which the trees come, date tree census was made, location, owner and orchard name.

The page is ruled into nine columns, which in this case were headed Standard, Barren, Light Crop, Northwestern Greening, Tolman Sweet, Replant, Missing, Dead or Diseased, and Half and Half (by that we meant half of the tree productive and half barren).

The tree census serves a double purpose in that it affords an accurate way of not only checking up the variations in types within a variety but also of checking up on whether the trees are true to the variety name.

An analysis of the trees in Row 1 will show the value of this record. These trees were 20 years old and were purchased from a supposedly reputable firm as guaranteed Northern Spys. Tree 1 was a Tolman Sweet, tree 2 a light crop Spy, tree 3 a Barren type Spy, trees 4 and 5 Northwestern Greenings, tree 6 a productive Spy, tree 7 a Northwestern Greening, trees 8 and 9 light crop Spys, tree 10 productive, trees 11 and 12 light crop Spys, 13 and 14 productive, 15 and 16 light crops, and 17 and 18 productive.

Out of a total of 90 trees in the first five rows as shown on this sheet, 35, or only about one-third, of the trees could be listed as productive and 21 of the trees were some other variety.

A second form is the Individual Tree Performance Record blank as used by the National Orange Company and a number of other citrus growers in California.

As a result of the fruit improvement investigations the National Orange Company has numbered every tree on their 1500 acres of citrus fruits near Riverside and Corona. They use the same system of tree numbering that we use in our experimental work, painting the plot number, row number and number of the tree in the row on the tree trunk in white lead paint. Thus they have not a duplicate tree number on all their holdings. Their trees averaged about 76 to the acre and the numbering was done by unskilled labor at a cost of less than 50 cents per acre.

Each tree is picked separately and the fruit assembled at the base of the tree. A large gang of 20 or 30 men require two extra men to secure these records. One man scatters the boxes under the tree, then after the tree has been picked the "secretary" (second man) comes along and marks down the number of full boxes in the column marked "Boxes" (see blank). The weight of the fractional box remaining, if there be one, is secured by means of a pair of scales which hook over the ends of the box, and is marked down in the column "Part Boxes in Pounds." Then by allowing a fixed tare for each full box the actual

NOTES—"Half and Half" means half productive and half barren.

number of pounds of fruit borne by each tree is secured. The fruit is hurriedly graded A, B, C or D as to quality, and if any distinctly off-type fruits are noticed a note is made of it. As the navels are picked twice each season space is left in the book for the two pickings.

That man's experience can be duplicated thousands of times in both citrus and deciduous orchards.

Conclusion

These differences are not confined to any one variety, to any one locality or to any one section. We have never been in an orchard, either citrus or deciduous, propagated in the old way by securing buds from slightly older trees in the nursery rows that we have not found marked variations in type and production.

We do not expect you to take our word alone for these things; we do not want to ask you to do that; and we do not have to ask you; all we need to say to you is, "Study your own trees; go out into your own orchard and see these variations for yourself, then ask yourself this question: 'Is not an individual tree study worth while?' You will find the answer in your own orchard."

These notes are transferred to six-year record blanks.

After a series of two or three years if they find a tree which is not up to standard they will rebud it, securing their buds from good productive trees on which they have actual performance records. If the tree is diseased it will be removed and another put in its place taken from their performance record nursery. Eventually they hope to make every one of their trees a high producing tree.

You will probably say that is a most interesting operation but it must prove very expensive. A surprising thing is that these records have been secured practically at no expense to the owners.

Under the old system of picking there was a box row through which the wagons drove with the empty boxes and through which the full boxes were hauled to the packing house. The pickers picked four rows each side of the box row. After they had picked a sack of fruit it was necessary for them to walk over to the box row and empty it. Under the new system the box row is still used. One man scatters the boxes under the trees, the "secretary" secures his record, and the two men carry the full boxes to the box row and load the wagons. The pickers, however, pick enough more fruit each day, over the old system when they walked to the box row to empty each sack of fruit, to more than pay for the two extra men's time.

Thus the only added expense involved is the time consumed in copying the records in the office onto the six-year record blanks.

It would seem that some modification of this method would be applicable to any orchard and the owner could then find out just what his trees were doing.

About the time the citrus improvement work was started one grower went on record as saying: "Well, that might be all right for some sections, but my trees are bearing all the fruit they can possibly hold." To prove his point he numbered all his trees and secured records on his tree yields. At the end of three years' time he found that 14 per cent of his trees were carried at an actual profit to himself, 38 per cent were neutral—that is, they were just paying expenses but not bringing in any return to the owner. He decided to carry them along a couple of years longer but thought they would eventually have to be rebudded. The remaining 48 per cent of his trees were carried at an actual loss to himself. These trees have since been budded over, the buds being taken from the productive trees in the 14 per cent column. Look at those figures! Only 14 per cent of his trees were carried at an actual profit, and that in a grove in which the owner thought his trees were bearing all the fruit they could possibly hold.

ARBITRATION OF DIFFERENCES

In a recent Fresno Republican we note in an account of proceedings of the chamber of commerce of that city the following regarding the action of certain raisin packers:

A big trade evil long existing between the dried fruit packers and growers is about to be remedied. A plan has been placed on foot by the California Dried Fruit Association to incorporate in future contracts between growers and packers an arbitration clause, according to E. L. Chaddock, who appeared before the directors of the chamber of commerce last night and outlined the new proposition.

The proposed contract has been thoroughly tried out by the Associated and has proven satisfactory to the grower. In fact, the Associated is the first packers' organization to give this privilege to the grower. The directors expressed favorable views on the movement and declared that as soon as the system is completed the president will be instructed to name a part of the members of the arbitrating board for Fresno. This will save growers considerable trouble, or at least it has done so for the raisin growers. The only raisin packers not using the new contract providing for arbitration of differences are those not affiliated with the Associated.

For a long time there have been differences between packers and growers that could not be amicably settled because there was no medium of settlement other than the court. The court proceedings over rejected fruit and the breaking of contracts have proven very unsatisfactory to all parties concerned and at the same time expensive. It will be up to the disputing parties to have the services of the arbitration commission if they so desire. It is the present plan to have the board paid for its work, and it is expected that payment will fall to the lot of the losing man. Of course no one can be forced to arbitrate, but it is the plan of the growers and packers interested in the new proposition to do away with court litigation so far as possible, at least on trivial matters.

The movement is statewide. Wherever there is a commercial organization it will be asked to appoint two members of the board who are not interested in fruit. The packers will appoint two and the growers one, or the four will select the fifth, according to the present plan. Should there be any objections to members of the board it will probably be arranged so that the board may be reduced to three active members, thus eliminating the possibility of any unfairness in decisions. The directors expressed themselves favorable to the plan and President Phillips said that the chamber of commerce members of the arbitration body will be named as soon as the final plans are perfected.

The Key to Successful Planting

"Successful Planting" means—the planting and growing of trees which will yield profitable crops. It is a great disappointment to find out after several years of cultivating and pruning that your trees are something different than you expected.

Every tree guaranteed true to name.

We grow everything that grows.

NO matter what you may be figuring on planting this season you can be sure of securing absolutely first class stock if you place your order with the Fancher Creek Nurseries. We have a splendid stock of all the best varieties of deciduous and citrus fruit and ornamental trees, vines, plants, etc. Every tree is of the same high quality that has made the name "Roeding" synonymous with quality and success.

Guarantee Your Planting

To plant "Roeding's True Trees" virtually amounts to guaranteeing your planting, for we take an interest in you and your orchard to help you to success. We offer you the benefit of our more than 30 years' experience in California horticulture, and are always glad to advise either in person or by letter with our customers, as to planting, pruning, irrigating, etc.

GREAT CROPS OF
STRAWBERRIES
And How to Grow Them

IS the most beautifully illustrated and most complete strawberry book ever written. It teaches the **Kellogg Way** of doing things and tells the whole strawberry story from start to finish. It explains how the famous Kellogg Pedigree plants are grown on the great Kellogg plant farms in Idaho, Oregon and Michigan, and pictures and describes all the best varieties, including the ever-bearing kind.

OUR FAMILY STRAWBERRY GARDEN

Whether you have a small garden or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries the year round for less than one cent per gallon. Our Book gives full information.

STRAWBERRIES

Yield more dollars per acre and give quicker returns than any other crop. Get our 64-page book and learn THE KELLOGG WAY, and make **$500 to $1200** per acre. The Book is FREE.

PLANT BERRIES

Alfred Mitting has had 47 years experience with berries from all over the world. His new berry, Macatawa, is the wonder, to all that see it in fruit. It is 3½ inches one way by 3¾ inches the other way. Send a postal card today for his 1915 catalogue with 1 colored plate, including the cream of all berries from a commercial standpoint or for home requirements.

ADVICE to farmers, orchardists and purchasers on all soil problems at rates with in their means. Write for particulars. **MARK WALKER, B. S., 211 West 1st Street, Los Angeles, Cal.**

STABLE MANURE

UNTIL recent years comparatively little knowledge of plant foods has reached the grower and even today the functions of the various food elements in the plant are not known. The scientist is even ignorant of the specific part that some play in the life history of a plant. It is not surprising then that the vegetable grower, and particularly the market gardener, should stick to the old standby and to a quite larger extent he should.

Stable manure is a very variable material. Its value is influenced by the method of feeding, the age and work of the horses fed, the care of the manure in the stable and out, the kind of bedding and whether the urine goes into the sewer or is largely absorbed and retained in the manure.

Chemists only get at a very small part of the value of stable manure when they tell us how much ammonia, phosphoric acid and potash it contains. These facts are very important but when we can purchase one 200-pound bag of chemical fertilizer that would cost us less than $3.00 and get as much plant food as one ton of manure would supply, we need to know why it is better to buy manure for at least part of our materials for soil improvement.

It is for soil improvement in a sense different from that of supplying plant food that stable manure is particularly beneficial. One of the most successful growers of fruit and vegetables in the United States remarked to the writer that if it were not for the manure he applied annually his soil would be so crusty and lumpy that he could not crop it successfully. Doubtless this is a fact. And this same soil will analyze as high in plant food as manure itself. It is for the indirect, or mechanical, effect that is brought about by the use of the manure that this grower finds stable manure particularly valuable.

Students of fertilizers and crops make a classification of benefits to soils through the application of fertilizers as "direct" and "indirect," and, as we usually think of the addition of plant food, particularly nitrogen, phosphoric acid and potash, as the direct benefits, it is fair to class the mechanical effect of stable manure as indirect. But just because this benefit is called indirect it must not be considered unimportant. Good mechanical condition of soils is essential to maximum crop production. Organic matter from manure is more valuable than organic matter from most other sources for it is in just that condition which causes most rapid decay. It is being learned at the present day that bacterial life is a most powerful factor in influencing almost every industry and all life. This is more particularly true with the business of farming It is the bacterial life present in manure, and for the growth of which stable manure in the soil seems to furnish an ideal place, that causes the organic matter to so quickly change to humus and the plant food in the manure to become quickly available.

The average amount of plant food elements contained in one ton of fresh complete stable manure are ten pounds of nitrogen, five pounds of phosphoric acid and ten pounds of potash. This includes the average amount of bedding used and it is expected that the large proportion of the liquid manure has been absorbed by the solid and the bedding. The plant food contents of various lots of stable manure will vary between eight and 16 pounds of nitrogen, four and eight pounds of phosphoric acid and eight and 16 pounds of potash. These variations are mostly caused by method of handling manure in the stable and the method of storing. Valuing the nitrogen in the manure at 16 cents a pound, what it costs in nitrate of soda, the phosphoric acid at four cents and the potash at four cents, we find that the average quality manure carries $2.20 worth of plant food per ton. A little study will quickly indicate that the cost of handling the ton of stable manure makes its use far less economical for its plant food contents than the use of commercial fertilizer. We must, then, lay much stress on the value of those two factors already referred to, namely the organic nature of the manure and the bacteria it carries.

To make our study and value estimate of stable manure more accurate we need to estimate the probable average loss in handling. These losses may be summed up under three heads—one of which has been mentioned and the other two are common knowledge to the vegetable grower: Loss of liquid manure in the stable; loss of soluble portion through leaching, seen so frequently in the vicinity of barnyards where manure is stored; loss by escape of ammonia as gas.

A competent authority states that "in general, it is safe to say that, under the usual careless manner of storing manure out of doors, over one-half of the plant food value is lost."

It becomes more and more evident, as a result of study, that the indirect values of stable manure are the important values and that the use of stable manure is good practice because it provides, not so much actual plant food, but brings about such suitable soil conditions for the growth of plants and such an abundance of bacterial life as to make organic plant food available.

The cover crop or green manure crop enthusiast will ask why manure is needed at all, because the necessary humus-making materials can be supplied in that way. The answer is: For general farming, an ideal system of green manuring combined with the proper use of commercial fertilizers will give splendid results. For vegetable growing where crop values are high, and hence land values proportionately high, the market grower can not, first, use the time to practice complete green manuring; second, his tillage is intensive and rarely can he supply sufficient organic matter by this system alone; third, this practice does not cause as rapid freeing of plant food, due to the nature of the material and the comparatively small supply of bacteria to cause rapid decay. Where possible an ideal system is to combine green manuring, the use of stable manure and commercial fertilizers.—Market Growers' Journal.

Planet Jr. Wheel Hoe Cultivators

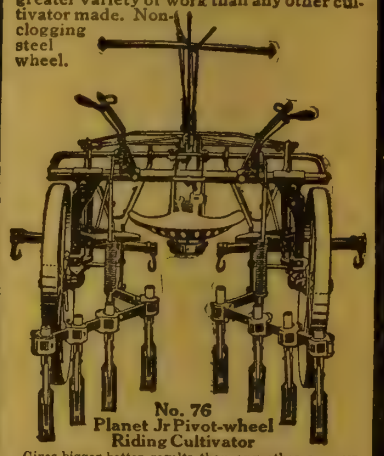
do the work of three to six men—do it better, give bigger results, and last a lifetime. Fully guaranteed.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. Light, but strong, and can be used by man, woman or boy. Indestructible steel frame.

No. 9 Planet Jr Horse Hoe and Cultivator

Stronger, better made, and capable of a greater variety of work than any other cultivator made. Non-clogging steel wheel.



No. 76 Planet Jr Pivot-wheel Riding Cultivator

Gives bigger better results than any other one-row cultivator ever invented. Strongly constructed; easily handled. No wood used except for break pins.

72-page Catalog (168 illustrations) **free**

Describes in detail over 55 tools, including Seeders Wheel Hoes, Horse Hoes, Harrows, Orchard-and Beet-Cultivators. **Send postal for it now.**

PLANNING A FARM GARDEN

IF there is any such thing as being "called" to work, then surely the gardener has the plainest and loudest call of all. Nature calls us all in spring and we must go; there is no getting around it; if we have the garden we want we simply can't resist. To dig in the soil and plant with design is man's prerogative, and he is not a full-grown man until he has done some little digging and planting. It is a sure cure for all ills and aches that man is heir to. Gardeners are healthy of both body and mind. They live long and enjoy life while they do live.

With the development of the country, the increase of consuming population, quick and efficient means of transportation, and the regular strong demand at good prices for garden products, gardening has come to be a permanent and large factor in the national prosperity. With villages, towns and cities scattered thickly all over the country, millions of people are ready to buy, and gardening either on a large or small scale has become a profitable occupation. There is always a good home demand for good vegetables, and distant cities consume almost unlimited quantities. There is never danger of oversupply of good, high-class vegetables, and the farmer who makes gardening a strong side line to his general work can add considerably to his yearly income without seriously interfering with his other work. It is also a means by which the wife, daughters or sons can make spare money of their own.

There is no better occupation for boys and girls than to grow and market garden produce. In this way they acquire skill in growing things and business methods in marketing them, and can often make enough money for cherished objects, starting a small bank account, or for attending college. Where sufficient land is to be had, the possibilities for making good money at gardening are as great as in many other trades and professions. For instance, a young woman can make as much or more money at growing celery as at school teaching or stenography. The same is true of growing onions, tomatoes, lima beans, and many other things. And these are only a few of the long list. A near-by young gardener last year cleared $1000 on his 10-acre patch, and I myself cleared $200 on one acre of pole lima beans, under the disadvantages of being 240 miles from the city to which they were sold. Gardening is an honorable occupation, and each year finds more talented young men and women engaged in it. In fact large numbers of college graduates are taking it up as a life work, and have no fear that their chosen occupation will ever interfere with their social, mental or financial advancement.

The vegetable gardener has one or all of three motives in his work—growing for pleasure, for family use and for market. The first usually dominates all gardeners, even though the products are to be used at home or sold. Also there are more educated and expert men and women engaged in the profession of gardening now than at any other time in history, and this number is increasing greatly. The man or woman who can grow plants successfully shows as great brain power and skill as professional men, inventors, composers and artists. Many of the widely known and highly esteemed men are gardeners.

The size and kind of one's vegetable garden will depend upon the available time and ground at command. On the farm there are great possibilities for gardening. One of the main points in vegetable gardening, whether the products are sold or for home use, is to get things out and force them to early maturity. If they are grown for the home table we want them as soon as anybody else; if they are to be sold on the open market a few days in the time of ripening may mean a difference between profit and loss. The very earliest products are the ones that bring the very top notch in prices.

For securing early maturity the gardener must make some provisions for starting and protecting the plants during early cold spring weather. A small greenhouse is best for this, but since few farmers have such, the hotbed and cold frame are cheap and serviceable. In the absence of any of these, young garden plants can be started in the house in a sunny window. The hotbed will enable the seed to germinate and the young plants to grow in spite of the cold, and the cold frame affords a place for the protection and hardening of the plants till the soil is warm enough to receive them. The hotbed is made by excavating a place and filling with stable manure for artificial heat. A frame is built to suit the size of the bed. Over the manure is placed a layer of soil three inches deep and the seeds planted in it after the heat becomes constant. It is well to have the hotbed covered with sash if tomatoes and such vegetables are sown; but for the sweet potato no covering is needed. In fact covering is not best on the sweet potato bed. However, if one is not able to secure the glass it may be covered with white cloth, which will serve the purpose very well. The cold frame is similar to a hotbed except that it has no bottom heat. The cold frame may also be covered with cheap white cloth; in fact gardeners frequently grow their lettuce and other early hardy vegetables in this manner. The thin cloth admits light and also protects the plants from frost and cold, chilling winds.

It goes without saying that the garden soil should be rich. It should also be well drained, for the more water that is drained away and the less that has to be evaporated at the surface, the sooner the soil will become warm. Evaporation at the surface of the soil lowers the soil temperature. The best fertilizers are those from stables, as the decaying matter furnishes some heat and also improves the texture of the soil, liberating available plant food and making it retentive of moisture. Commercial fertilizers should only be used by the expert or under the direction of a skilled gardener. The garden should be arranged and planted so that all cultivation can be done with wheel hoes or horse tools. Very little gardening can be done with the hand hoe. Set all plants in rows far enough apart to permit cultivation.—Fruit Grower.

SCIENTIFIC SOIL CULTURE

By H. W. Campbell

OF all branches of science that have had the attention of this country, none is more vital to the prosperity and happiness of the farmer, the business men and their commercial interests than tillage. Tillage of the right kind at the right time in an average year has more influence in obtaining the big crop of high quality grain, fruit or vegetables than rains or ample irrigation without scientific tillage. Ample and timely rains or abundant irrigation are good; yes, important; yet the certainty of crop and the high limit of yield and quality are never obtained without scientific soil culture.

To Know How the Great Essential

An engineer throws his reverse lever forward, then pulls the throttle and his engine moves ahead; as he pulls the throttle wider the velocity increases until the usual fifty-mile speed is attained. As he rounds a curve a red flag—the signal of danger—is noticed; he quickly shuts off the steam with one hand and applies the air with the other. He shuts the throttle because he knew the energy that was carrying that train at so high a speed forward was powerless when the steam was shut entirely out of the cylinder; he also knew the momentum already obtained would carry the train to destruction if something was not done quickly. He well knew that a certain slight movement of a certain lever would apply in an instant every air brake of the entire train. Thus directed by his knowledge of these facts the train is brought to a standstill before the danger point is reached. Because of the engineer's control of his train through his absolute knowledge of his engine, joy pervades the minds of all the passengers instead of grief, sorrow and continued worry.

The Farmer Also Needs It

So, too, have the farm crops become damaged or ruined over large portions of many states, and grief, sorrow and continued worry confront thousands of farmers and their families because the danger line was crossed and the whole train of bright anticipations have been wrecked; not entirely because of carelessness—not because the signal of warning that indicated danger was not given—but because the farmer did not know how to develop or control the great motive power in the growing of his crop. He did not know that his tank in which he must carry his supply of water to promote the needed energy was leaking badly. Enough had been lost to carry him from the starting of the growing of his crops to their finish; all of which could have been so easily prevented by a little "know how." Nor had he the precise knowledge of the principles of operating the mechanical part necessary to develop the motive power requisite for the growth of his crop to the high degree that is found in the tried and faithful passenger engineer above referred to who was compelled to learn every principle in detail before he was permitted to even try to manage his engine.

It is the "know how" of the great lawyer that commands the retainer fee of from $10,000 to $25,000. It's the "know how" of the great artist that makes his paintings worth $10,000 when yours copied from the same subject would not bring $10.00. It's the "know how" of the man who commands the great or small position as president, manager, superintendent or foreman, and enables him to earn a salary, while the man with less of the "know how" or "know why," but with possibly more muscle, commands only wages. So, too, the farmer that knows how to plow, plant, and cultivate his land at the right time in the correct manner with the proper tools expects larger crops of a better quality, and gets them. But, you say, sometimes he does not; if he failed we insist he made a mistake. Mistakes in soil tillage, and bad ones, too, are sometimes made by all of us. It is so easy to make a mistake that the most of us spend the greater part of our time trying to get out of the trouble these mistakes have brought us into. However, mistakes are rarely made by the one who, because of long training, study, and experience, really does "know how." They are usually the result of guessing or gambling methods; the way possibly that did bring results once and may again when the same accidental conditions may attain a condition of the soil that always has and always will bring results, but the average tiller of the soil knows only in part what it is, why it was or how it was done, and much less how it can be done again.

The New West

There is a new west that has been very largely settled in the past seven years, covering mainly western Nebraska and Kansas, eastern Colorado, Wyoming, Montana and the western portion of the Dakotas, prior to which date was all conceded only a grazing country, but the discovery and introduction of newer methods and principles of tillage, a little of that real "know how" has changed its possible future. During the first four years of the seven the rainfall was up to normal, and conditions improved very rapidly. The socalled dry farming seemed simple enough, and everybody saw nothing but unending success; but, about three years ago, the rainfall began to decrease in some sections, and what precipitation there was seems to have grown less timely, until it has been found necessary to resort to something more definite. Scientific soil culture is coming to the rescue, which simply means the "know how," or the application of more thoroughly scientific principles and methods of tillage that recognize the necessity of a certain physical condition of the soil by and through which not only can good to fair crops be grown in drouthy years, such as sometimes come, but all crops can be proportionately increased in good years.

The Skeptic and the Careless

Too many are heeding the warning of the skeptic who becomes horrified at any apparent turning from the

beaten path of the past, and holds up both hands and insists "it can't be done." He points with pride to the man he says tried it and failed (failed because he did not know how), then serenely folds his arms and closes his speech by that glorifying adage "I told you so."

Don't listen to these men; their ambition is to prevent you from advancing ahead of them. Try better tillage—intensive tillage—scientific tillage—call it what you please, but try it, and if you fail or find trouble, don't give it up; it's because you have made a mistake; you did not quite understand all the hows and whys. Great, yes, phenomenal results have been obtained by those who follow out the correct principles and it's up to you to learn how to do as well or better. Be an honest booster and not a reckless knocker.

Some Results

In 1905 a branch experimental farm was established at North Platte, Nebraska, by the state agricultural college for the main purpose of thoroughly trying scientific soil culture. The years of 1906, 1907 and 1908 show about the normal rainfall of 18 inches each year. In 1906 the records of the state on wheat yields were broken by the harvest of 54 bushels of wheat per acre on this station; in 1907 the records were again broken by the production of 62 bushels of wheat per acre. 1909 was quite dry, and only 45½ bushels per acre were grown; 1910 was still more drouthy and 37½ bushels were grown. Do not these records stand out boldly for scientific soil culture in good years as well as dry? Don't be so unwise as to say, "O, this is only the result of a state experiment station," for what one man can do, so can another, if he knows how.—Campbell's Scientific Farmer.

MORE ABOUT RICE

Written for the California Cultivator By Sacramento Valey Contributor

A great many people in California are greatly interested in rice at this time—and all sorts of questions are being asked about the crop, its origin, characteristics, history, etc.

Rice is supposed to have originated in India. It is an annual grain producing grass, and there are varieties suited for growing on dry lands, or rather on lands without submerging, as well as in overflowed checks with irrigation. From India rice has been taken to the entire civilized world, to the countries about the eastern end of the Mediterranean sea before Christ and to Italy in the 14th century. It was first cultivated in the United States in South Carolina in 1694—seed having been taken from a cargo and planted in gardens. Cultivation spread to all of the south Atlantic and gulf states as far west as Louisiana and Texas. Now California promises to be a big producer and higher per acre yields are now being secured here than anywhere else in this country.

Beside being the principal food of the peoples of the orient rice is used in Europe in starch making and in India for an alcoholic beverage. The national drink in Japan, sake, is also distilled from fermented rice.

In China and Japan irrigated rice is called "water rice," that grown without irrigation, "dry land rice." About 300 pounds of rice per capita per year is consumed in these countries—or 475,000,000 people use 71,250,000 tons annually.

Rice must be grown on over 97,000 square miles of territory to produce this. All but about 5000 square miles is irrigated.

It is estimated that an average yield for water rice in the orient is 40 bushels (45 pounds per bushel)—or 1800 pounds per acre, that of dry land rice about 20 bushels or 900 pounds.

In Japan 53 per cent of the irrigated rice lands are in fields of less than one-eighth of an acre. The levelling and preparing these fields by hand labor has been an enorous job, one that American farmers can scarcely realize.

Practically all of the rice grown in China and Japan is first planted in nursery beds then transplanted to the fields. These beds are highly fertilized and irrigated. When the plants are eight to ten inches high they are transplanted to the fields. A month is saved in the growing of the crop by this transplanting. The nursery bed can be started earlier than rice could be planted in the open field. The plants are kept in the nursery until they have strong feeder roots—so that when transplanted into rich land they soon begin to make rapid growth.

At transplanting time the plants are pulled, the roots washed, and the plants tied in bundles of a size that can be handled easily in the field in transplanting. Gangs of seven or ten or more laborers, generally whole families, set the plants in wet, puddled, rich soil in rows one foot apart, six or eight plants in a hill and the hills eight or nine inches apart in the row. The soil is made into the consistency of mortar and the planters go barefooted. A man sets about one-third of an acre a day.

After planting the crop is hoed, fertilized and irrigated, all laborious hand labor. Much of the irrigation water is pumped by foot power pumps or lifted in crude devices by hand.

Most of the harvesting is done with the hand sickle and the bundles are often hung on racks to dry before threshing. Much of the threshing is done by pulling the heads through a metal comb and fanning the chaff from the kernels as it is dropped from a basket to the ground, and some of the polishing is done by hand in a wooden mortar.

We have much to learn about rice in this country but our problems must be worked out along different lines from those followed in the orient.

Kirkman's Reliable Trees

Make Horticulture Profitable

Our stock of fruit trees in several of the leading varieties will be entirely exhausted before February 1st. We hope to be able to supply at least all of our old customers with what they will need. Write us at once please, letting us know what varieties you expect to plant. We want to supply you if we can.

Kirkman Nurseries

2519 Tulare St. **FRESNO, CAL.**

LILLY'S **Soluble Sulphur Compound** **SPRAY**

The Sulphur Spray in Dry Form

A Marvelous Success—East, West and everywhere. Manufactured on Pacific Coast under Niagara patents. Advertised and sold in the East as

NIAGARA SOLUBLE SULPHUR COMPOUND

This powerful spray material dissolves instantly in hot or cold water, and, in the long run, there is no better or cheaper spray material.

For the Control of San Jose Scale Read These Twelve Reasons

Why Lilly's Soluble Sulphur Compound is the economical, practical, efficient and convenient spray material for the practical fruit grower:

1—100 pounds of LILLY'S SOLUBLE SULPHUR COMPOUND is equivalent to 600 pounds of commercial lime-sulphur solution. Why pay freight on water?

2—A 100-pound drum of LILLY'S SOLUBLE SULPHUR COMPOUND makes more diluted spray material than a barrel of lime-sulphur solution; reducing the actual cost of material.

3—LILLY'S SOLUBLE SULPHUR COMpound is neat and convenient to handle.

4—LILLY'S SOLUBLE SULPHUR COMPOUND comes in inexpensive metal drums, which when empty may be thrown away; no money paid out for barrels; no bother returning empty packages.

5—Its powdered form makes leakage impossible.

6—LILLY'S SOLUBLE SULPHUR COMPOUND keeps indefinitely anywhere, and can be held over from one season to another without loss.

7—LILLY'S SOLUBLE SULPHUR COMPOUND is equal to and has proven many times to be superior to lime-sulphur solution in insecticidal and fungicidal value.

8—A drum of LILLY'S SOLUBLE SULPHUR COMPOUND may be carried in buggy or automobile, making hauling convenient and inexpensive. One man handles it easily.

9—LILLY'S SOLUBLE SULPHUR COMPOUND may easily be obtained in small packages. It is put up in 100, 50, 25, 10, 5 and 1 pound cans.

10—LILLY'S SOLUBLE SULPHUR COMPOUND is at least 25% cheaper to use than lime and sulphur solution, when it is considered that a 100-pound drum makes 60% more spray than a barrel of lime-sulphur solution; less expense in hauling and handling; no loss from leakage and crystallization; keeps indefinitely and no empty barrel to return.

11—Will not wash off the trees.

12—Leaves a fine, waxy finish on fruit.

LILLY'S SPRAY BULLETIN No. 30 tells more about this wonderful spray. It also tells HOW TO SPRAY FOR SUCCESS. It deals with spray problems in a masterly way. It is worth hundreds of thousands of dollars to you. You can have it for the asking.

Go to your dealer NOW and tell him you want LILLY'S SOLUBLE SULPHUR COMPOUND or send to us direct at Seattle or Portland, and we will ship from the nearest distributing point.

$7.50 per 100-lb. drum
1.25 per 10-lb. can
.20 per 1-lb. can

Hill Street Between 4th and 5th.

Wilson's Quality Trees

Are in heavy demand this season. The selection of buds from established bearing orchards, careful selection of seed, causing healthy, vigorous growth—THE REASON. The following letter is one out of many thousands we have received in the past:

Grass Valley, Calif., Dec. 7th, 1914.

Fresno Nursery Co., Inc., Fresno, Calif.
Dear Sirs: In January, 1912, I received from your nursery 210 walnut trees of three varieties, which I am pleased to say have yielded since the first year of planting, each variety bearing a few nuts of excellent quality and TRUE-TO-NAME. I never lost one single tree of your shipment. The 600 pear trees received at the same time as the walnuts are also very satisfactory. My trees have done so well that the local paper has given considerable space about the vigorous growth of my orchard.
Very truly, (Signed) GORDON S. MORGAN.

That tells the story.—Prospective Planters, give us an opportunity of starting you right by supplying strictly first class nursery stock. Send us a list of your requirements for quotations. Our large 52 Page Book describes all varieties of Fruit Trees, Grape Vines, Ornamental Trees and Shrubs, Palms, Roses, etc. We send this book free upon request. Remember we specialize on DECIDUOUS FRUIT TREES, CITRUS TREES, OLIVE TREES, FIG TREES, GRAPE VINES, and Hardy Ornamentals. Write us if you want the best that money will buy. Address

THE FRESNO NURSERY CO., Inc. 300-340 Cherry Ave., Fresno, Cal.

Economics on the Farm

THE FARM INVENTORY

ALL good business concerns take a regular inventory. Very few farmers keep even a record of their receipts and expenditures, and an extremely small percentage ever think of taking an inventory. For several reasons the farm inventory, properly kept, is one of the most essential features of the business side of the farm operations. The inventory should show all assets, including land and improvements, stock, farm equipment, cash, notes receivable, accounts receivable and everything whatsoever of any value, and all liabilities, including mortgages, notes payable, accounts payable, etc. If the inventory is properly taken the balance between the assets and the liabilities wil show the present worth of the individual. This balance compared with the balance of the preceding year will show the net returns for the current year. For example, if my assets January 1, 1915, equal $14,356.25 and my liabilities equal $5,231.75, my present worth January 1, 1915, would be the difference, or $9124.50. If my present worth January 1, 1914, was $7436.50 the net returns from my business for the year 1914 would be $9124.50 minus $7436.50, which equals $1688.00. This gives the farmer the best guide available as to whether he is getting ahead each year.

Keeping a record of receipts and expenses is essential, but the receipts minus the expenses will seldom give a correct idea of the net returns of the business for the year. Some new machinery may have been purchased, some breeding stock may have been added or some permanent improvement added to the place. These would make the expenditures run high, making the net receipts seem very low for the year; yet the machinery, the stock or the improvements would increase the farmers' assets and present worth at the close of the year by almost their entire cost, if properly cared for. On the other hand, there may have been a reduction in stock or equipment, swelling the receipts and making apparently high returns for the year, but incorrectly credited as the product of the year's business. The present worth would not be altered, although the form of certain assets may have been changed.

A proper inventory should include every item of equipment on the farm. This periodical checking up on every item, estimating its value, noting depreciation or its entire loss in many cases, leads to greater care in using and storing equipment. Such inventory would reveal sources of expense and loss due to neglect or carelessness that would reach total amounts surprising to most farmers.

The annual inventory tends toward a more accurate rating of the different features of the business. The man who never places a valuation on hay and grain fed on the farm is apt to overestimate the returns from certain stock and underestimate the crop side of his farming. Again an inventory showing the cost and depreciation of equipment connected with some one phase of the business like potato production, for example, will usually show a much greater charge against the crop for that item than many imagine. It will also usually show the importance of specializing to a certain extent so that a given equipment may handle more stuff. For example, a full equipment of up-to-date potato growers' machinery would place a prohibitive charge against five acres of potatoes, whereas the charge would be far less important on 50 acres.

The inventory furnishes an accurate basis for determining the profitableness of the business. In the example cited above, the $1688.00 net returns for 1914 is not satisfactory unless it covers a reasonable interest on my present worth of January 1, 1914, and in addition pays what wages I could have earned above the expenses of keeping my family. If other members of my family have given their time to the farm also and could have earned regular wages elsewhere the $1688.00 should cover their possible wages also. In other words, if I could have placed my $7436.50 at interest January 1, 1914, and the wage earners of my family and myself could have earned enough after maintaining the family to make more than $1688.00 when added to the year's interest on $7436.50 I am not conducting my business successfully. Many farmers who make no allowance for their own time would find upon taking careful inventory each year that they are not making fair wages for themselves after allowing reasonable interest on the money invested.

For Sale Everywhere

is when there is least salable and consumable products on hand. This will usually be some time during the winter or early spring. Taken at this time, it will show the farmer before the season's work opens what new tools or repairs are needed.

The inventory should be carefully taken, but when once properly taken the succeeding inventories are simple. A record book should be secured that will hold the inventory for several years. Every item should be listed at the left side of the page and as carefully classified as possible. When there are two or more items of one kind, like plows, cows or horses, they should, as far as possible, be listed separately by name or number, rather than recording as three plows, four horses, etc. The inventory will be much more accurate and it will enable one to keep closer track of the separate items of equipment and of changes in equipment. This would apply to everything that is carried two or more years, like work animals, producing stock or machinery, but things produced for sale within the year would quite properly be valued collectively as 10 pigs, 53 chickens, etc. In the latter cases the breeding stock would be listed separately from the sale stock.

The value of each item at the time of taking first inventory should be inserted in the first vertical column to right of list and under date of inventory. Each succeeding year's inventory values will be placed in the first vacant column to the right in each case. When an item is sold, worn out or lost, note of the fact can be made under the proper date. When the first list is made enough vacant lines should be left at the end of each class of articles to take care of all additions to the class for several years. If each new item and price is recorded when purchased, when the second and succeeding inventories are taken, one has but to check over all items recorded and he knows that he has gone over all his working equipment. Many things, like feed, store stuff like potatoes, hay and apples, to be sold, fattening pigs and all such stuff that does not carry along from year to year, will have to be listed anew each year and will bear no necessary relation to the last year's list.

The value and accuracy of the inventory as a key to the owner's progress, lies not alone with the completeness of the inventory but with the judgment used in placing valuations. The land and the improvements may well be listed and valued separately. The valuation placed upon such improvements as buildings and fences will decrease according to the wear and tear, but will be raised at any time by repairs placed upon them. Increased cost of building material and labor may raise the real value enough or more than enough to make up for deterioration. Such factors must be considered. Proper management may increase the producing value of the land five, ten, fifteen or more dollars per acre. The inventory may honestly indicate such increase in valuation. The reverse may happen also. Any stable rise in value of land, due to general development of the country, may properly be shown in the inventory as it would represent a real increase in the owner's assets. Extreme temporary fluctuations in the values due to disturbed financial or industrial conditions had better be ignored in the inventory unless one intends to take advantage of temporary conditions by closing out business as it gives no indication of a man's permanent worth.

One general rule may be distinctly used in the value of all items to be sold or to be retained upon the farm. If for sale, place at the market value, whether high or low. If to be retained, place at its normal value for use on the farm. Three illustrations will suffice. Suppose we have 20 tons of alfalfa hay, the usual value on our farm being $12.00 per ton. Temporary conditions have raised the price to $20 per ton. If it is for sale we can properly place it in our inventory for $20. If we have cows and are wise enough not to get scared and sell out we will have to feed the alfalfa and can realize only what it is worth for feed. It will give us a truer indication of our present worth to inventory it at its freed value, for that is all that we are going to realize out of it. Again, suppose we have five brood sows. Temporary demand has placed an abnormal value on brood sows and ours could be sold at 50 per cent more than they are normally worth. If we are to retain them, they should be inventoried at their normal value. Again, suppose we purchase a new binder. At the next inventory date it would, if carefuly handled, be worth within 10 per cent of its cost for continued use on the farm, while its sale value would be reduced probably one-third or more because it becomes second-hand. The wearing value is the proper one to give in the inventory.

In short, "sale value" for all things for sale and "use" or "wearing value" for all things to be retained will make the inventory the most useful guide to the farmers' real financial standing.—Geo. Severance, Agriculturist, Washington Agricultural College.

DISCREPANCY IN MARKETING

In Mr. Roeding's article on the peach he refers to the cause of low prices of dried fruit and seems to think it is on account of the quality or because fruit has not been peeled and put up in attractive shape. If this is true peach men should do their best to correct the omission but is there not another cause? I think the main cause is in our marketing system, especially with the retail men. The farmer is getting three cents per pound for his dried peaches and the consumer is paying ten cents or more. There is too much discrepancy. Besides, if the consumer pays ten cents certainly the producer should receive as much as five cents. If retailers could be content with a lesser profit and all fruit could reach the consumer at a lower price vastly more of it would be consumed. Is there not some way of correcting this evil?—John E. New, Reedley.

NUMBER OF APPLE TREES IN STATE

There are, according to figures compiled by the secretary of the apple show, held in San Francisco, 5,784,000 apple trees in the state, divided among the thirty counties as follows:

Alameda, 8,000; Butte, 60,000; El Dorado, 16,000; Fresno, 30,000; Humboldt, 126,000; Inyo, 110,000; Lake 15,000; Los Angeles, 180,000; Madera, 30,000; Mendocino, 650,000; Monterey, 500,000; Napa, 160,000; Nevada, 16,000; Placer, 26,000; Riverside, 150,000; Sacramento, 40,000; San Bernardino, 380,000; San Benito, 60,000; San Diego, 150,000; San Joaquin, 27,000; Santa Barbara, 60,000; Santa Clara, 60,000; Santa Cruz, 2,000,000; Shasta, 35,000; Siskiyou, 100,000; Sonoma, 700,000 Sutter, 30,000; Tehama, 25,000; Yolo, 25,000; Yuba, 15,000.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

TWO COTTON CROPS

Some Imperial Valley growers are claiming a production of two bales of cotton per acre, but secured through two plantings in one year. The first crop was harvested in June, in fact, the ginning was done on June 17, said to be the earliest record yet made in the United States. Then, according to newspaper reports, new seed was planted on the same ground and on October 15 the second bale on the same acre was ginned. It is possible the newspaper account is somewhat deficient in accuracy of detail, but there is indication that valuable results were obtained by a little attention to intensive cultivation. California climate, soil and water conditions are such that two or more crops a year are possible, and if conditions change so that a reasonable price may be secured every farmer should use his soil to the limit.

SHOP EARLY

A few eastern farm papers are urging farmers to help in restoring business confidence and better times by buying at once, implements, seeds and supplies needed for spring operations. Whether this would aid materially in advancing our general prosperity we are not certain, but we believe it would aid in advancing the prosperity of the farmer, that is, thorough preparation for the coming campaign by having supplies all in hand gives a command of conditions which may arise which the backward farmer may not have. Perhaps to that extent the present campaign will aid in securing a return of prosperity. In any case, let us all be hopeful and let us plan for the future; let us plan for big crops. Along some lines it must be admitted there are still large supplies on hand and little immediate promise of early clearing of the markets, but before another year's productions are ready to offer it is to be presumed that there will be peace on the high seas and ships will be engaged in carrying merchandise rather than those supplies that are used to destroy merchandise.

A FINE BOOK

The Cultivator is proud of the first number of its series of books. As announced some weeks ago, the first number will be a manual of poultry practice. It is written by one who has had the hard knocks of practical experience in California poultry raising. It is not intended as a complete treatise or last word in poultry culture, but we will claim for it that it is one of the most helpful books for the poultry learner we have yet seen. It acknowledges that there are great difficulties in the way of poultry success and tells how to overcome them. The author, Mrs. Koethen, has written for Cultivator readers for some years and has given proof of her ability to say things in a clean-cut, informing way. Her book is even more helpful than her articles, and we know will deserve a place in the library of every farmer, for every farmer does, or should, keep a few head of poultry. The book will be off the press in a short time, and as soon as the first copies are bound they will be mailed to those who have already ordered. It is taking a little longer than was anticipated, but if those who are waiting for the book will have a little patience, it will be received, and we believe prove the best dollar's worth ever secured in the book line.

CANADIAN BREEDERS' CLUBS

The minister of agriculture of Canada is at the head of a thoroughly up-to-date agricultural department. One of the latest advance steps by this department, more particularly by the live stock commissioner, is a service which will greatly advance Canadian horse breeding interests. Stated briefly, the scheme is as follows: The farmers of any district wishing to work for the betterment of horse breeding by encouraging the use of sound, individually excellent pure-bred sires may form a breeders' club, for the purpose of hiring a pure-bred stallion for the benefit of the members. These breeders' clubs, by organizing under and adopting the constitution and by-laws and conforming to the various rules and regulations governing this grant may participate in the federal assistance given to such clubs. This consists in paying practically 25 per cent of the service fees on a guaranteed number of mares. Regular fees are to be charged and one-fourth of these fees are to be returned to the Dominion government to compensate it and ultimately pay for the animal. This is securing some of the best blooded stock to be had and placing it at the service of the farmer and without investment of large sums. The result is most beneficial.

STATE ECONOMIES

While it is being urged that we all economize at every turn, even to the extent of going without our pie, or even doughnuts, that the Belgians and others nearer home may have bread, perhaps it is in order to suggest to our state legislature that this is a good year for economy. There has been wonderful improvement in the handling of state matters within the past few years. Perhaps with the growing state and the growing demands of the people there may be equally as large sums spent as formerly, but we believe to far better purpose.

Of course this is 1915, the year we have long been looking forward to, and we cannot withhold our hospitality during the year when our visitors are coming, but there are at every session of our legislature thousands—and the word, "thousands" is not an exaggeration—of bills presented which lead to the pork barrel. It will be a service greatly appreciated if our legislators will scan these bills very carefully and cut out every measure—with as much economy of time as possible—which shall not have to do with direct and immediate advancement of the state's interests. As an eastern paper has said when appealing for similar action on the part of its state legislature:

"A good house cleaning is needed, and economies can be instituted here and there that will patch the clothes of indigent children, rest tired mothers and lift mortgages from despondent homes."

THE FARMER PAYS

Speaking of the recent advance in freight rates permitted by the interstate commerce commission a national lecturer of the Farmers' Educational and Cooperative Union referred to the fact that no matter what advance might be permitted the railroads or any other transportation or manufacturing interest, the farmer would pay the bill. No matter what the financial loss or the increase of cost, the farmer, who initiates everything, must pay the bill. Had the eight-hour bill carried this would have added still another burden to the farmer, not only because of the immediate advance in his payroll, but because the plows, the cultivators and the transportation would all cost more.

"When a farmer buys a plow he pays the man who mined the metal, the woodman who felled the tree, the manufacturer who assembled the raw material and shaped it into an article of usefulness, the railroad that transported it and the dealer who sold him the goods. He pays the wages of labor and capital employed in the transaction as well as the price of the tools, machinery, buildings, etc., used in the construction of the commodity, and the same applies to all articles of use and diet of himself and those engaged in the subsidiary lines of industry.

"The total value of the nation's annual agricultural products is around $12,000,000,000, and it is safe to estimate that 95 cents on every dollar goes to meeting the expenses of subsidiary industries. The farmer does not work more than 30 minutes per day for himself; the remaining 13 hours of the day's toil he devotes to meeting the payroll of the hired hands of agriculture, such as the manufacturer, railroad, commercial and other servants.

"The farmers of the United States are not financially able to carry 'dead heads' on their payrolls. Our own hired hands are not paid unless we have something for them to do, and we are not willing to carry the hired help of dependent industries unless there is work for them. We must therefore insist upon the most rigid economy."

Merced will hold a two-days' farmers' institute Friday and Saturday, January 29-30. Dr. Coit of the state university will deliver an address on fig culture.

Agricultural Notes

There has been a steady increase in the value of pineapple importations to this country. During the first ten months of 1914 they totaled $1,306,689.

A movement to bring Belgian widows and children to this country to help solve the domestic and farm help problem is being pushed by the Oklahoma Farmer-Stockman.

The International Union of Municipal Dairies will hold its seventh international congress at Stockholm, Sweden, this year. The sixth congress was held in Berne, Switzerland.

During one week, from Monday, December 14, to Saturday, December 19, 1914, the receipts at the Union Stock Yards, Chicago, were 442,453 head of live stock, for which producers are said to have received in cash $11,134,210.

The federal bureau of plant industry is urging potato planters to use as seed only potatoes which have been inspected and bear the white label of the potato inspection service of this bureau. This precaution is because of the danger from powdery scab infection.

An anti-alien land ownership bill is up before the Idaho legislature. It provides that no land in the state may be held by an alien who has not declared intention of becoming a citizen, and that where aliens come into possession of land by inheritance or lien they must dispose of it within five years.

A memorial issue of gold and silver coins to commemorate the Panama-Pacific International Exposition has been authorized by congress. The measure authorizes the coinage of fifty-dollar, two-and-one-half-dollar and one-dollar gold pieces. A part of the issue of gold fifty dollar pieces would be after the model coins issued in California in 1851.

A plan is being presented to the Cuban government to bring in from Europe 15,000 families to colonize different sections. Each family is to be given free passage, placed on 33 1-3 acres of land and maintained for one year. The project is not alone designed to encourage Spanish emigration to Cuba, but also men from other countries—Swiss, Danes, Belgians and from northern Italy.

On the suggestion of David Lubin, delegate of the United States to the International Institute of Agriculture at Rome, congress has passed a resolution aimed to bring about a series of treaties between all nations to steady the world's prices of staples. A conference is called in Rome in 1917, the conference to consist of members appointed by each government adhering to the institute to consider the establishment of a permanent international commerce commission on merchant marine and ocean freight rates.

A moving picture machine attached to an auto is the latest idea of the Louisiana agricultural department. A short time ago the government furnished the university with moving pictures showing the latest methods of intensive farming. But as electrical apparatus and lighting facilities were almost always lacking in the rural communities where the pictures were to be shown, the farmers were forced to forego the educational campaign that had been planned for their especial benefit. Now the problem is solved by attaching a small dynamo to the car. The outfit can be handled and operated by one man.

Agricultural News Notes of the Pacific Coast

Northern California

Cloverdale announces there will be no citrus fair in 1915. This is the first failure to hold the exposition in 23 years.

Approximately 12,000 carloads of vegetables were shipped out of California during 1914, the largest amounts being of potatoes, onions and celery.

A big farmers' meeting is called for Willits, Mendocino County, February 2, for the purpose of organizing a farm bureau and applying for a county farm adviser.

Shipments of deciduous fruit from the state for 1914 totaled 16,146 carloads as compared with 13,331 in 1913. These figures are for all green fruits exclusive of apples.

A mass meeting of farmers of Mendocino County has been announced for the first week in February. It is to be held at Willits and it is proposed to effect an organization for the purpose of securing a county farm adviser.

The secretary of agriculture has authorized the grazing of 9,600 head of cattle, 400 horses, 50 swine, 16,200 sheep and 1,000 goats upon the El Dorado national forest for the grazing season of 1915. Forest Supervisor Evan W. Kelley of Placer County will receive grazing applications until March 1.

The forest service has made a new ruling of importance to stock breeders whose herds graze in the national forests. Where request is made by a majority of users of any grazing grounds in a national forest the forest service will refuse to permit breeding animals of low grade on the range. The rule will become effective February 1.

The Northern California Beekeepers' Association met in Sacramento the last two days of December to consider legislation of interest to bee men. The following officers were elected for the ensuing year: Harry K. Hill, Willows, president; Mrs. L. D. Walker, Sacramento, vice-president; A. L. Heim, Fair Oaks, secretary-treasurer; E. L. Sechrist, Fair Oaks, director; B. B. Hogaboom, Elk Grove, director.

A sweeping quarantine order has been issued by Governor Johnson prohibiting importation into California from all but 16 states of cattle, swine and sheep because of fear of the foot-and-mouth disease. The states excepted are: Washington, Oregon, Idaho, Nevada, Utah, Arizona, Colorado, New Mexico, North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Texas, Minnesota, Arkansas and Louisiana.

The annual meeting and banquet of the Humboldt County Dairymen's Association was held January 5. The association charges members five per cent for handling their business and report for the year shows a good balance in the treasury. Officers for the ensuing year were elected as follows: President, Harry A. Perry; first vice-president, Louis East; second vice-president, J. N. Fulmor; secretary and treasurer, J. M. Christiansen; directors, J. J. Hansen of Metropolitan, H. F. Harbers of Waddington and M. L. Pontoni of Arcata.

Central California

A farmers' institute was held at Modesto January 7-9.

A carload of apples was recently shipped from Watsonville to Copenhagen.

Persons who graze cattle on the national forests are supplied free of cost with blackleg vaccine on application to foresters.

A bill has been introduced to the legislature for the establishment by the state of free labor exchanges.

A working model of the LaGrange dam will be installed at the Panama-Pacific Exposition by the Modesto chamber of commerce.

The Oakvale Farmers' Club held an institute at the Kings River school house January 15. Practical demonstrations were given in pruning.

The Turlock branch of the Stanislaus County farm bureau now has 120 members. The next meeting of the bureau will be held on the first Tuesday in February.

There was a poultry show in connection with the farmers' institute held at Hanford January 15. Professor Dougherty of the state university talked to poultrymen.

The Inland Waterways' Association of California will meet in San Francisco March 25-27, 1915. This will be the first great congress to convene at the new exposition auditorium.

Flockmasters of the district about McKittrick in Kern County are planning for the annual spring shearing. They report a good growth of grass in the valleys and expect a good heavy wool clip.

The interstate commerce commission announced recently that the proposed increase in freight rates on melons from Sacramento and nearby points to Portland, Seattle and Tacoma are justified.

It is announced that on the 15th of February 60 sections of land eliminated from the Kern national forest will be open to settlement. Practically four-fifths of this was patented before it was withdrawn.

The Ahwahnee unit of the Madera County farm bureau will hold its next meeting January 27 at the Worman ranch. County Adviser Mayhew will be present and give practical demonstrations of planting and pruning.

There is a reward of $25 for the arrest and conviction of anyone killing a pheasant. This statement has been issued by the state fish and game commission to correct an impression that the present is an open season for these birds.

"Sun-Maid" is the name of a new brand of raisins to be placed on the market by the Associated Raisin Company. The cartons will be standard size and will carry illustrations of the San Joaquin Valley and recipes for use of the raisins.

Fresno County has a new ordinance which requires that all growers of, and dealers in nursery stock must register with the county commission of horticulture. No charge is made for registration but there is a heavy penalty for those who do not comply with the provisions of the ordinance.

Southern California

Riversiders are talking up a county fair for this year.

Corona is building a new lemon packing house.

San Dimas orange men estimate the crop at about 75 per cent of normal.

This is the height of the celery shipping season of Orange County.

A bill has been brought before the state legislature to prevent hunting of bear from June 1 to October 16.

The orange packing houses of Highland are doing a big business, one house having 107 employes on its payroll.

Report comes from Garden Grove, Orange County, that the acreage of chili peppers will be greatly decreased this year.

The National Orange Show at San Bernardino 17-24 will give particular attention to citrus by-products. Prizes are offered.

New and more stringent regulations governing importation of cottonseed into Imperial County have already gone into effect.

The Anaheim Walnut Growers' Association has added equipment costing over $6,000 to its packing house during the past season.

The Imperial Valley land office bill has been changed to include a part of Riverside County in the district assigned to the proposed new office.

Poultrymen of Arlington, Riverside County, have signed up to market their eggs cooperatively. The organization is to be modeled on the Petaluma plan.

Orange County has a new milk and dairy inspector in the person of A. L. Barlow, inspector of the Los Angeles health department. His headquarters are at Buena Park.

Santa Monica is proposing to have a rooster barbecue early in May. It is proposed to enact a city ordinance that will practically prohibit chicken raising in the residence district.

The Anaheim Walnut Growers' Association held its annual meeting at its packing house on Saturday, January 9. The association has only 7,000 sacks remaining unsold of this season's crop. It has never handled a crop of finer quality.

The Yorba Linda Citrus Association held its annual meeting Saturday, January 9. The meeting was addressed by Professor H. S. Fawcett on bark and gum disease of citrus trees. G. Harold Powell, sales manager of the exchange, also spoke on marketing.

Shipments of cotton from the United States during the month of December showed 1,110,595 bales, as compared with 1,230,000 during December of 1913. In addition large orders are in sight from Germany, Russia, Austria, Hungary and Italy. Japan has also been buying liberally.

Mr. Francis Cuttle of Riverside is urging citrus growers to pool their experience as to whether it pays best to prune or not to prune frozen citrus trees. There was much discussion on this subject immediately following the big freeze two years ago and Mr. Cuttle suggests that the present is the time to obtain authoritative information on the subject.

The Coast

The farmers' union of Chandler, Arizona, held a broomcorn meeting January 16.

Forest fires in British Columbia covered more than 300,000 acres during the past year.

There will be a convention of the National Beekeepers' Association at Denver February 16-18.

The second annual show of the Utah State Poultry Association is being held this week at Salt Lake City.

Seventeen million dollars' worth of live stock was sold in Portland during the year 1914.

General Villa has issued an order prohibiting exportation of cattle from Mexican territory under his control.

The farmers' week at the Arizona college of agriculture at Tucson had more than double last year's attendance.

The Province of Saskatchewan has presented to the British government 1,500 horses to be used as cavalry mounts.

It is reported that there is a big market in Hawaii for box shook for packing canned pineapple and pineapple juice.

Poultrymen of Chandler, Arizona, held a meeting the day after Christmas to organize an association. The association will hold a show January 28-30.

A horse show will be one of the notable features at the conference week to be held at the Oregon agricultural college at Corvallis, February 1-7.

The Oregon irrigation conference held at Portland the first week in January had the largest attendance of any congress in the history of the association.

The annual farmers' round-up and housekeepers' conference of Southern Utah was conducted by the Utah agricultural college at Richfield the second week in January.

The Idaho State Dairymen's Association convened at Boise January 12-13. The market situation of the Northwest was one of the principal topics of discussion.

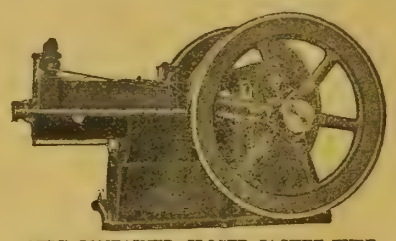
The foot-and-mouth disease quarantine declared by the state of Nevada has been materially modified by a new order which allows transportation of cattle through the state to California.

The Northern Arizona Poultry Association has changed its name to Arizona Poultry Breeders' Association, having received its charter as official state branch of the American Poultry Association.

The State Grain Growers, Millers and Shippers' Association of Washington has elected R. C. Lord of Spokane, president. The association advocates a change in the present grading system of grain.

The annual meeting of the Arizona State Poultry Association was held January 9 at Phoenix. W. W. Carney of Mesa was chosen president, G. W. Mears of Phoenix, vice-president; H. G. Powers, secretary; Mrs. G. W. Mears, treasurer.

We Want Every Earmer to Learn About Alpha Engines



SELF-CONTAINED CLOSED JACKET TYPE ALPHA ENGINE

There are two things you should consider carefully in buying an engine for farm use.

RELIABILITY

and

FUEL ECONOMY

Both depend on design and construction.

SIZES—2 H. P. to 100 H. P.

TYPES—Hopper Cooled. Closed Jacket, Tank or Screen Cooled. Portable or Semi-portable.

FUEL—Gas, Gasoline, Kerosene and Low Grade Distillate.

GOVERNOR—Hit and Miss or Throttling Type.

IGNITION—All ALPHA ENGINES have the new "built-in," gear-driven, gear-timed magneto. Guaranteed for the life of the engine.

NO BATTERIES

NO COIL

NO CRANKING

EASY STARTING

Send for special circular 2A, that tells
HOW ALPHA ENGINES ARE BUILT
and why they give
SERVICE PLUS ECONOMY

"Jackson MADE"

The fidelity and regularity with which a "Jackson Made" pump does its work is almost human—no attention is needed—it simply goes on pump, pump, pumping—hour after hour delivering the maximum amount at the minimum expense.

Tell us your pumping problems and our expert engineers will gladly help you free of cost.

For every pumping condition there is a "Jackson Made," which, in satisfactory results, absence of repairs and costly upkeep, excels every other make.

Write for Catalog No. 48G

Chubbuck's Ideal Gopher Trap

Result of years' experimental work. Poisons are dangerous, gases uncertain. The Ideal is only Trap that will positively catch large or small gopher. Being round with thin edges rodent walks into it before detecting anything in runway. 100 per cent efficient. Easiest to set. Farmers say it is worth dozen other makes. Saves lawns, gardens, valuable trees. Price 50c at dealers. Will be sent postpaid to any address in U. S. on receipt of 60c; two traps for $1.10; six for $3.00. Money back if not satisfied.

FEEDING SORGHUM TO STEERS

ANSWERING an inquiry in regard to the feeding of steers on silage and sorghum hay, Prof. F. W. Wilson, animal husbandman of the Arizona agricultural experiment station, says:

Your ration of 25 pounds of silage and 10 pounds of sorghum hay is not sufficient as a ration for growing and fattening steers. It is entirely too wide for an economical gain in weight. Further, in order to make up the requirement for growing steers such as you would probably feed, it would be necessary to increase the number of pounds; consequently, on account of its bulk it would be rather difficult for your animals to handle enough of this feed to make the required gains. I would suggest that grain or some other concentrate would be advisable, provided it can be economically produced or shipped to your railroad station. I believe that pasture is worth more than $2 a month in the Salt River Valley and in the Imperial Valley. We have found that sorghum rations alone were undobutedly inferior to alfalfa alone, but in combination with alfalfa yield greater gains than when fed alone. This was true with a series of experiments with beef cattle, also with sheep.

The shrinkage of the animals fed alfalfa and combined rations, that is, alfalfa and carbohydrate feeds, was practically the same, although there seems to be slightly more with combined rations. At this time there is no discrimination between the quality of meats produced on combined rations such as alfalfa, milo maize, sorghum, etc., and that of steers on rations of alfalfa alone; in fact there is no discrimination that I have been able to learn between animals that are corn fed, those from the range, or grain fed in Arizona. I have found that with the use of alfalfa in combination with such feeds as you mention we get approximately the same results as when alfalfa is fed alone.

The general practice in feeding sorghum, especially in irrigated valleys, is to simply turn the cattle into the fields when the herds are well grown, allowing them to feed at will. Later the residue is picked up by stock and young cattle. In many instances sorghum cannot be conveniently handled for feeding in corrals. My experience in western Kansas in the feeding of sorghum hay was to simply cut the crop, rake, shock and leave it in the field; when it became necessary to use this forage I hauled the feed in as required. The forage is usually distributed over the ground. This method is considered economical for the reason that there are no expensive corrals and feeding racks to build; moreover it is much easier to dispose of the residue in the way of coarse stalks, roots, etc. I think that we can be safe in saying that a ration of cane hay or milo maize ensilage and dry hay will not compare very favorably as a meat producer with the alfalfa pastures and alfalfa hay of the irrigated valleys of the southwest. A combination of this feed with alfalfa would probably give you very good results; however I believe that alfalfa hay would be rather expensive for you to feed.

Milo silage is a great deal higher in crude protein, carbohydrates and fat than amber cane silage; consequently, we would consider it a much better silage for the fattening of steers. However, it has been found that cane silage makes an excellent grade of dairy ensilage. My idea of your proposed ration would be that it is perhaps just a little bit better than a maintenance ration; hence you would expect your animals to make but little gain in weight. Probably ensilage and cane hay could be economically used in your section of the country in connection with the feeding of animals that are not doing well on the range, particularly old cows. A little feed at the proper time is of a great deal of benefit to animals that are in a rundown condition, and it would be a great saving to the cattlemen of your section if they would make more use of crops such as you have suggested.

I have been unable to find anything definite relative to Egyptian wheat as an ensilage. Sudan grass is a little higher in carbohydrates and also a little lower in fat than cane hay. It should make a very successful feed for your section of the country in view of the fact that it does not require a great deal of water and, moreover, is a very quick growing crop. In some sections of Texas it will make a hay crop in 60 days.

POINTS ON CHURNING

Always scald the churn out well before churning.

Regular and frequent churning is preferable to heavy and irregular churning.

Stir cream well after each separation. Never add warm cream to cold, nor add sweet to sour. Keep it all sweet until ready to ripen.

In working the butter, all the milk and water should be removed from it, which will add to its flavor, appearance and good keeping qualities.

Sweet cream makes better flavored butter than sour cream, but it is somewhat harder to churn and does not yield quite the amount of butter sour cream does.

If one churns too quickly much of the butter will be left in the milk and the product will be of a poorer quality than if churned in the proper time, about 30 to 50 minutes being acknowledged as the correct period for securing best results. Butter comes sooner than this though under certain conditions, especially in winter.

The most satisfactory results are secured by churning with the vessel not over one-half full of cream—one-third full will be even better; so there will be ample agitation and splashing of the cream to separate the fat-globules and produce the maximum amount of sweet, solid, well-flavored butter.

Before attempting to churn cream, it is better to let it sour till it tastes about as ordinary butter. This supplies more acid than is in sweet cream, which aids in breaking up the butter-fat globules, causing all the butter to be extracted. If the cream is slow in souring, set it near the stove and stir

GUERNSEY CATTLE CLUB
BOX C. C. PETERBORO, N. H.

Purebred Registered
HOLSTEIN CATTLE

Our Advanced Registry Office for the year ending May 1, 1914, shows that 9,116 cows (nearly one-quarter heifers), produced within a seven-day period 3,672,371 pounds milk containing 130,339 pounds butter-fat, averaging 3.55 per cent. The average for each animal (not mentioning the calves that sell at from $100 to $20,000 each) was 27 quarts milk per day and 16¾ pounds of the best commercial butter in seven days. These figures show why the dairymen prefer Holsteins.

frequently till the warmth turns it to the proper flavor for easy churning and good butter.

Where the cream froths in churning, it is too cold—a very common error. In such case, do not try to warm it by adding hot water or setting it over a fire, but secure a good-sized vessel (tub, large candy-pail or boiler). Fill it with water as warm as the hand will bear, set the churn in it and let the temperature of the cream rise till it stops frothing; then remove the churn from the water and continue churning. Adding hot water to warm the cream scalds and injures the butter-particles till much of the butter will be lost and gives that which is secured a sickly, whitish color, it being soft, greasy and of very inferior grade.—Successful Farming.

PNEUMONIA IN HORSES

It is very easy for horses to contract pneumonia during the spring months. If the horses have become warm from work and stand unblanketed for an hour or more in the wind they readily take cold and frequently the lungs are affected.

Pneumonia is inflammation of the lungs, the horse has a high fever, 105 degrees, and the pulse is so rapid in many cases that one cannot count it. The animal refuses feed, the hair all over the body stands erect, the breathing is labored, the eyes partly closed and inside of lids very red. If one sees the horse in the early stages he will notice the animal having a chill the same as a person. The surface of the body is cold, while the inside of animal is hot with fever.

Put your affected horse in a box stall where there is plenty of air but do not allow the wind to blow on him. Put a mustard plaster over the lungs, of equal parts mustard and flour. Then cover with two or three warm blankets. Give the horse all the water he wants. Give him any feed he will eat. You can keep the high temperature down by frequent rectal injections of cold water. If your patient will eat bran mashes they will be valuable in keeping the bowels laxative, as the high fever has caused constipation.—C. L. Barnes, Colorado Agricultural College.

COYOTES

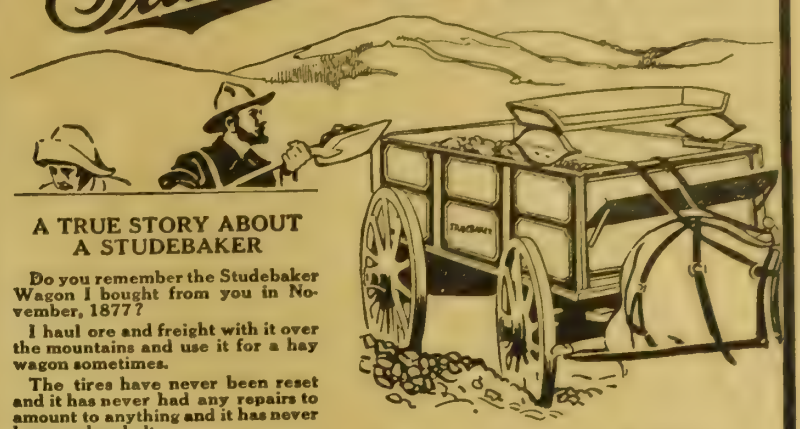
We may truthfully say that the coyotes with the advance of civilization are holding their own, if not increasing.

During the winter season lack of their natural food will cause the coyotes to seek the nearby ranches and feed upon domestic animals. Coyotes are very cunning and somewhat difficult to trap or poison. On account of his craftiness the coyote is a prominent figure in Indian myths. One is as follows:

The Deity and creator of the Karok religion was Kareya, who made the fishes, animals, and finally man. Him he commanded to assemble all the animals, in order to assign to each his rank, by distributing bows and arrows, the longest to the most powerful, and so on.

The birds and beasts came together the night before the distribution and all went to sleep except the coyote, who determined to stay awake all night and go forth earliest in the morning to get the longest bow, but overreached himself and fell asleep just before dawn. When he opened his eyes only the shortest bow was left for him. But Kareya, pitying his weakness and disappointment, gave him cunning ten times greater than

Studebaker
WAGONS BUGGIES HARNESS



A TRUE STORY ABOUT A STUDEBAKER

Do you remember the Studebaker Wagon I bought from you in November, 1877?

I haul ore and freight with it over the mountains and use it for a hay wagon sometimes.

The tires have never been reset and it has never had any repairs to amount to anything and it has never been under shelter.

It is a good old wagon yet and capable of being used for many years to come.

Ray McLaughlin,
Hayman, Col.

36 year old Studebaker hauling ore over mountains

THINK what this sturdy wagon, bought in 1877, has earned for its owner.

—and think how very little he has spent on it for repairs. Even the tires have not had to be set.

—and it has never been under shelter,

What you can expect from a Studebaker

A remarkable story. But no more than is expected of a Studebaker.

Air dried wood, tested iron and steel, good paint and varnish and skilled workmanship are bound to give satisfaction—and lasting results.

That's why it pays to buy a Studebaker.

It is true you may be offered a wagon represented to be "just as good" and costing less. But don't be imposed upon. A wagon is as good as its life is long—and Studebaker wagons are cheapest in the end.

What you want is a wagon that will last a lifetime, run easily and not cost you continual small sums for repairs.

And that is what you get when you buy a Studebaker. Sixty-three years of wagon building integrity insure you against the mistakes of the manufacturer who makes farm wagons to sell cheap.

Remember a Studebaker is sold at the lowest price for which it is possible to make a trustworthy wagon.

—and the same is true of Studebaker Harness and Buggies.

STUDEBAKER, South Bend, Ind.

Really Cheap Alfalfa Land Within 35 miles of Los Angeles

The RESERVED LANDS of the CHINO RANCH, 35 miles east of Los Angeles, have been placed in our hands for sale,

At Bargain Prices

The CHINO RANCHO is noted for the prosperity of its farmers. The soil is deep, rich, fertile. There is an abundance of water underlying the property. On the land which is for sale the pumping lift should not exceed 25 feet—which means CHEAP WATER.

Much of the land faces upon county roads, for the paving of which bonds have been voted. This will give quick and easy communication to THREE good towns and shipping points, on three railroads.

We believe that a man who understands

Hog Raising

Can make more than a good living off 20 acres of this land, partly planted in alfalfa, raising part of his fattening food, buying part of it. The land is good for beets, general farming, gardening and fruit as well as alfalfa.

We will sell good level land, which can be readily watered at low expense, as cheap as

$175 an Acre

And make very easy terms. THIS IS THE LAST of the Chino irrigable ranch lands. Inquiry has been FAST, it is going to sell FAST, the land is ALL GOOD, but SOME IS BETTER. Those who come EARLY get their pick.

Special terms will be made to men who have had experience in HOG RAISING.

The production of olives in the state for 1914 is placed at 27,500 tons, at a gross value of $2,750,000.

before, so that he is sharp-witted above all animals.

The following methods for poisoning have been used successfully:

Take the regular 2-grain capsules and fill with sulphate of strychnine. Securely cap and wipe all trace of the drug from the outside. Insert one capsule in a piece of beef suet the size of a walnut and close the cavity to keep out moisture. The poisoned bait should never be handled except with gloves or forceps, so as not to have any human scent. The bait may be placed around any carcass on which the coyotes are feeding or along trails they are in the habit of following.—W. L. Burnett, Colorado Agricultural College.

NATIONAL ASSOCIATION

The eighteenth annual convention of the American Live Stock Association will meet at San Francisco March 24 and continue three days, according to the official call issued today by Secretary T. W. Tomlinson. Officials of the Panama-Pacific Exposition have designated March 26 as American Live Stock Association day.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Brain Trouble

I have a horse seven years old that is very restless and does not want to stand at all. He walks around with his head down, stumbles over things, or will butt up against the wall of the barn and does not seem to care. He eats heartily and does not seem to suffer but does not take on any flesh. Can you tell me anything to do for him?—Subscriber, Jackson.

Probably something is wrong with his brain. It may be a small abscess or tumor, or it might be simply congestion. You might try giving him half an ounce of bromide of potash in the drinking water two or three times a day.

Dyspepsia

What is the cause of my mules eating up the corral fences and hayracks? —Subscriber, Plano.

Dyspepsia causes a continual craving. It is caused by overfeeding or a lack of something in the feed. They do not need medicine; the cure is regular and proper feeding. Give water frequently. Feed them each in the morning three pounds of hay and three pounds of grain; no more. At noon feed each three pounds of hay and three to eight pounds of grain, according to the work they are doing. In the evening give each eight to twelve pounds of hay, according to the size, and when this is half eaten give as much grain as you gave at noon. When not eating or working keep them tied so they cannot reach anything to gnaw at. In a short time they will be cured and then continue this method of feeding. Every day they do not work cut out the grain at noon but do not increase the hay. A horse or mule only needs one pound of hay a day for each 100 pounds weight of the animal, and about the same amount of grain when working.

Cow Aborts

Cow aborted and afterbirth did not come and after waiting 36 hours I attempted to remove it myself.

Some small parts were easily removed but the bulk of it was grown very firmly to the uterus, so that it could not be removed. In the attempt a part of it was torn from the wall of the cavity producing a severe hemorrhage. The parts were then washed with a two per cent solution of zenoleum. The operation was performed four days ago and since then the cow has had more or less fever, and at times seems to be in pain and refuses to eat anything. She has not come to her regular milk.—Subscriber, Ontario.

The cure would be to remove the whole of the afterbirth and thoroughly irrigate the uterus with a good antiseptic solution. The two per cent solution of zenoleum that you used is all right. The afterbirth is attached to the uterus by about 40 cotyledons, and at maturity they separate. By careful manipulation they can be separated without causing a hemorrhage. By rough handling you have caused large ulcers and those coming in contact with the retained portion of the afterbirth causes blood poison. That is the cause of the pain and fever. If a good veterinarian is in reach you had better employ him to complete the job and he will probably save the cow.

Cancer

Horse has had a sore on the shoulder for about two months; think it was scratched by barbed wire. When first noticed it was about the size of a half dollar and dripped blood all the time, but now is 20 times larger. It does not cause any lameness. Veterinarian cut it out but now says he can not cure it. What can we do to check the growth and stop the bleeding? —Subscriber, Princeton.

While cancer is uncommon in the horse we fear this may be one. Would not advise you to give it up too soon. Try this: Get half a pound of formaldehyde and some vaseline. Clip off the hair around the sore and apply plenty of vaseline. Then with a swab apply plenty of the formaldehyde to the sore. This will burn and smart and you will have to tie the horse so he cannot rub it against anything. Apply the formaldehyde several times inside of a few hours. This will form a scab and when it loosens wet the parts once a day with a solution of permanganate of potash; one dram to the quart of water. When it begins to heal grease the edges with bacon fat to keep the skin soft. If it is a cancer nothing will stop it, but it may only be a summer sore and in that case treatment will cure it.

Colt in Poor Condition

Have a colt that will be three years old next spring that is about half the size it should be. It is so extremely poor that it is unsteady on its legs. At times its hind legs stock up, its lower jaw becomes swollen, and in fact the whole head has a swollen appearance. It eats very little. This condition has existed since last spring, when it was castrated. Would castrating cause such a reaction? It was not in the best of condition when castrated. How can its nutrition be improved?—Subscriber.

The castrating might have something to do with the trouble, but since you say "it was not in the best condition when castrated" it may be worms that is keeping him down. First examine him where he was castrated. The cords may have been left too long and have grown to the scrotum. If they have you will find hard lumps as large as an English walnut or larger where the testicles were. They must be removed, and only a veterinarian can do that. After this treat for worms by giving the following: Spirits of turpentine, three ounces; tincture of iron, two ounces; aloin, four drams, and enough raw linseed oil to make one quart. Mix. Shake the bottle well and every other day give four ounces of the mixture. If it physics him do not give it so often but give it all. When you have finished this write again, referring to this article, and tell what the results are and we will advise you what to do next.

Overfed Goat

I have a young milch goat that will often lie and grunt as if oppressed in her stomach. She is a hearty eater and keeps fat on a little but is not too fat. She is with kid since October but used to grunt the same way last summer. They are all yarded and fed hay and a variety of fresh greens. She comes of a heavy milking stock. —Subscriber, San Luis Obispo.

Probably the goat eats too much and the distended stomach does distress her. You should feed her by herself and limit the feed. In a short time the muscles of the stomach will contract to the normal size and she will feel better and even do better in every way.

Read our guarantee of advertisements and advertisers. Quacks and swindlers can't break into these columns with a stick of dynamite.

Faulty Eyesight

I would like to know what is wrong with my horses. They seem stiff in their backs and their hind legs. When they go in and out of the barn they step about two feet high and seem to be in pain while doing it. If one pulls on the halter rope while leading them they pull back and keep pulling until they get loose. Pressure on back of the head or top of the neck seems to hurt them. They eat and drink well. This is a desert country, and they have been running on bunch grass part of the time for three months. —Subscriber, Inyokern.

The backing and pulling at the halter is only a habit. Have someone follow up with a good whip and when they start backing a few lashes will stop that trouble. The high stepping on entering or leaving the stable is probably due to poor eyesight. Probably your stable is dark and they cannot see in. Put plenty of windows in the stable.

HAULING HOGS IN FORD

Mr. T. C. Slaughter of Gardena has a novel and expeditious way of getting his pure-bred Poland Chinas to market. It consists of his Ford auto, to which is attached a two-wheeled trailer. The two wheels from which this trailer is made and the axle were secured from an old castaway automobile. The wheels are very substantial, have rubber tires, and underneath the bed of the trailer is a pair of heavy springs. He can put a ton of live hogs on this and connect the pole with a metal plate which he has attached to the underside of his auto. He says he can start to market over Los Angeles County's good roads and take with him a ton of produce at 25 miles per hour.

Alfalfa Seed

Every field where Seed we offer for sale was grown in 1914 was thoroughly inspected by us for dodder, noxious weeds, etc., before it was harvested.

Everything we offer has been government tested to make our assurance doubly sure, both as to germination and foul weeds.

We are actually offering California's best product.

If you are looking for cheap, unreliable stuff, you will have to look elsewhere, but if you want good seed at an honest price we can serve you.

Samples, prices, etc., on application.

V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

The only exclusive Alfalfa Seed Dealers in the West.

HEY HAVE 'EM IN AUSTRALIA TOO

A request has been preferred for a efinition of the word "kicker." Let be understood straight away that a kicker" is not one who voices a legitimate trouble or grievance. The "kicker" is another class of man altogether. He waters too much and blames the soil when his crop is a failure; he refuses to make a proper head ditch and blames the grading when the water breaks away and causes trouble; he wants bridges and other facilities provided in impossible places and thinks himself hard done by when he can't get them. Generally he chafes at any necessary regulation or ordinance as a matter of principle and looks at everything connected with the scheme through somber colored spectacles.

His kind are happily becoming scarce on the areas these times as the drouth is showing how much better off a settler is there than on a dry-farming proposition, but he and his like will occasionally make their presence known no doubt for many years to come.

OLD MISSION CHURCH AND PLAZA OF LOS ANGELES AS IT APPEARED 50 YEARS AGO.

It is hard to tell the "kicker" from the well-known gentleman who is always "'agin' the government"; in fact, the names are interchangeable.—Irrigation Record, Leeton, Australia.

FOREST FIRES HARM SOIL FERTILITY

A definite relation between the amount of humus, or vegetable matter in the soil, and its crop-producing power as shown by yields of corn is given in figures just issued by the department of agriculture. The department therefore advocates the use of various methods to introduce the required humus into the soil.

Experts of the forest service state that the soils of the whole country, and particularly of the south, have lost and are losing immense amounts of this source of soil fertility through forest fires which apparently do little immediate damage but rob the soil of accumulations of humus. In many parts of the southwest land is being cleared for farming, and where such forest land has not been burned there is a large percentage of vegetable matter which provides considerable fertility and a good texture. Moreover this soil has a greater capacity to absorb and retain moisture and thus is less likely to be washed and gullied under heavy rains. For these reasons, leaving out of account the damage to standing timber, the department's authorities are agreed that fire should be rigidly kept out of woodlands.

The farmers' week of the Missouri college of agriculture provides instruction not only for farmers and farm women, but has special courses for boys from 10 to 18 years of age and for girls of the same age.

New Macatawa Everbearing Blackberry

Wonderful Vitality

Four out of the six "Macatawa" have started growth, which is satisfactory considering the roots were only packed in paper and sent this long distance.
Yours, faithfully,
TERCY FOWLER.
Shanghai, China, July 6, 1913

THE MACATAWA originated by Alfred Mitting, in 1909, at Holland, Michigan, a cross between the true Giant Himalaya and the Eldorado, and offered to the trade in the fall of 1912. I have named it the Macatawa as that term carries to me the idea of our cold Michigan winters and our occasional dry summers, which this berry stands without the slightest damage. It went through the extreme cold winter of 1911-12 in an exposed condition without freezing. The Macatawa has characteristics of both its parents. The fruit is very large and sweet, in fact it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe, and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way, by three and one-fourth inches the other way.

It begins blooming in the southern and coast states about February 15. In the eastern states about April 1st. One month later you can begin to pick. It is a continual cropper from Spring until the frosts, in fact it is the only berry in my 46 years' experience that is an everbearing variety.

Its habit is similar to that of the Eldorado, but self branching, and the bloom is almost semi double, about the size of a silver dollar. So far, all who have tried the berry, say that it is the sweetest and best flavored berry they ever tried. When it was in fruit at Berrydale, it was admired by everyone that saw it, and three thousand plants were sold to said visitors, in the fall of 1912. The young plants come from suckers and not from tips, but it is a shy sucker maker, so we propagate by digging up the roots between the rows and cutting same into one, and one and one-half inch pieces. These piece roots are sown in rows four inches deep, and the rows two feet apart. They should be sown in the southern and coast states from December 1st to March 1st, in the center states from March 1st to May 1st. By the next fall you will have nice plants full of fiber roots, and the plants will be 18 inches high and ready to plant in the field for fruit. Our price for these piece roots is $10 per thousand, one year old plants, $2 per dozen, $12 per hundred, $100 per 1000. 50 plants go at 100 rates, 500 at thousand rates.

The Macatawa Berry is 3½ inches one way by 3¾ inches the other

ARTIFICIAL BROODING OF CHICKENS

THE artificial method of brooding chickens, according to the United States department of agriculture's specialist, consists in supplying artificially, as nearly as possible, the heat furnished by the hen under natural conditions. The temperature of a hen is about 106 degrees Fahrenheit, but as hens seldom sit closely on chickens the latter do not receive this degree of heat. Hens adapt their methods of brooding to conditions, such as temperature, size of the chickens, wet weather, etc., and the operator of a brooder must meet these conditions as well as he can. This lack of adjustability to changes is one of the weakest points in our present brooders and brooder systems. Some of the most important faults in the management of brooders are overcrowding and lack of ventilation, while the chickens fail to get sufficient exercise. The brooder should supply the proper temperature, be readily adapted to changes in weather conditions and be easy to clean and well ventilated.

Chickens are usually left in the incubator from 24 to 36 hours after hatching, without feeding, before they are removed to the brooder, which should have been in operation for a day or two at the proper temperature for receiving the chickens. A beginner should try his brooding system carefully before he uses it. After placing the chickens in the brooder they can be given feed and water. Subsequent loss in chickens is frequently due to chilling received while taking them from the incubator to the brooder. They should be moved in a covered basket or receptacle in cool or cold weather.

Hovers, Brooders and Brooding Systems

There are a large number of hovers, brooders and brooding systems used throughout the country, some with success, although many are discarded as failures, while each year brings some modification or change. One poultryman uses a system successfully, while his neighbor may make a failure of the same system but does well with another. More difference of opinion exists as to the value of brooding systems than in any other part of poultry rearing, which shows that no system is ideal for all conditions or all people, but that success depends largely on individual handling and care. Many failures in brooding are due to weak chickens, which may be traced to faulty incubation or weakness in the breeding stock. Successful rearing of chickens depends primarily upon having healthy, vigorous breeding stock.

Brooding systems may be classified as follows, according to their capacity: Individual brooders or hovers holding from 25 to 100 chickens; coal, gasoline and engine or distillate oilstove brooders, with a capacity varying from 200 to 1,200 chicks; and hot-water pipe systems, the capacity of which is unlimited. The beginner, if possible, should thoroughly investigate the brooding equipment used on successful poultry farms which have been in operation for some years.

Individual Hovers and Brooders

The small individual hovers and brooders are heated with either hot air or hot water, with kerosene oil as the source of heat. Hovers are used entirely inside, either in brooder houses or in small colony houses, while brooders are made for both indoor and outdoor use. Outdoor brooders are used with success and work very satisfactorily under most weather conditions. The capacity of brooders and hovers is often overestimated, and one-half to two-thirds of the number of chickens commonly advised will do much better than a larger number. The danger from fire, due frequently to carelessness and lack of attention, is considerable in cheap brooders and hovers, while there is some risk in the best grades, although proper care will reduce this to a minimum. Individual hovers in colony houses or several in one large house are giving quite general satisfaction on small poultry farms, while the pipe system of brooding is commonly used in large commercial poultry plants and where extensive winter brooding is done. When a lamp is used as the source of heat, care should be taken to keep the wick and burner properly cleaned. Brooder lamps and stoves should be inspected several times a day. Do not fill the brooder lamp quite full of oil, as the heat from the lighted wick will expand the oil in the bowl and may cause it to overflow and catch fire.

Gasoline brooders, brooder stoves burning engine-distillate oil, and a separate individual hover heated by a coal fire are coming into more general use, each with a capacity varying from 200 to 1,500 chickens. These large individual brooders are used in colony houses, and when the chickens are weaned the colony house is used as a growing coop, which requires a smaller investment than the long, piped brooder house, and allows one to rear the chicks on range to good advantage. Brooder stoves with a capacity of from 500 to 1,500 chickens, heated by distillate oil, are used quite extensively in some sections of the country. These stoves are usually seen in houses which are about 18 feet square, but are occasionally found in long brooder houses. Most of them are equipped with a water regulator that controls the flow of oil, which is fed automatically from a tank or barrel outside the house, or several stoves may be connected with the same supply tank. This system provides good ventilation, sufficient heat to keep the chickens from crowding, and requires a minimum of care.

Until one has had considerable experience it is best not to brood over 1,000 chickens in one flock, and a much smaller number would probably do better.

Individual hovers with a capacity of from 200 to 1,000 chickens have recently been placed on the market and appear to be giving satisfaction. Each hover is heated by a separate self-feeding coal stove which is adapted for use in a colony brooder house. The value of this brooder would appear to depend greatly on the efficiency of the heater and the

time required to care for the stove.

Hot-Water Pipe Brooders

This system consists of long brooder houses, heated with hot water, coal being used for fuel almost exclusively. Many of the latest mammoth brooders are giving good success, and in these cases the labor of brooding a large number of chickens is less than where small individual brooders or hovers are used. These brooders are suitable for large poultry farms or for farms where most of the chickens are raised during the winter and early spring.

Method of Heating

Brooders are heated either by overhead or bottom heat or by a combination of these two methods. Too much bottom heat does not give good results, while either the overhead or the combination methods are used successfully. Many pipe systems have a hover or cover over a section of the pipes in each pen, while others are used without them, and each appears to give good results with different operators. A piece of wool felt or cotton flannel is often used for this purpose. Gas and electricity are also used for heating brooders and hovers with good success, and where available they supply one of the steadiest and most convenient sources of heat. A brooder built along the style of the oil brooder stoves, with gas or electricity as the source of heat, should prove very satisfactory. Heaters for the mammoth brooders or hot-water pipe systems are usually equipped with automatic regulators, which are operated either by expansion of water or electric contact. Both types of regulators have given good satisfaction. A reliable regulator is very essential to success with any of these systems.

DRAWING POULTRY

The poultry handling specialists of the United States department of agriculture are urging housewives to buy their chickens undrawn and with their heads and feet still on. An undrawn chicken, they say, shows its lack of freshness or its unfitness for food much more clearly than does a fully dressed bird, in the dressing of which certain significant signs can easily be removed by the crafty poultry dresser.

Moreover, by actual government tests as reported in Circular No. 70 of the bureau of chemistry, fully drawn poultry with head and feet removed decomposes the most rapidly, while undrawn poultry keeps much better than does poultry either wholly or partly drawn. This is because once a chicken is opened for cleaning the delicate tissues in it are open to the bacteria of the air which multiply very rapidly and soon destroy the flavor of the chicken, even if they do not bring about actual putrefaction. The undressed chicken is far less likely to be contaminated in this way as the outer skin is a protection against the inroads of such bacteria.

When the feet of chickens are removed the housewife loses one of the easiest methods of determining whether the bird is young or old. Young chickens have smooth, clean feet and shanks. Old birds have scaly, rough legs and buttons or spurs. The head of a dead chicken gives very clear indications of staleness. The head of a chicken that is not fresh will show a greenish color below the bill, sunken eyes, and a darkening or discoloration on the neck, all of which indicate decay.

The housewife should require that the entrails of a chicken be not drawn, or at least should have the butcher draw them in her presence. Moreover, the entrails of the chicken often show fully conditions that are not evident after the bird is fully drawn. The appearance of the entrails will help her to tell whether the chicken is fresh and whether it has been properly handled. Entrails in a good chicken should be almost empty, round, firm in texture, and showing little red veins here and there. If the intestines are full the bird was not starved for 24 hours before killing as it should have been, or else sand was fed to it to increase its weight and work a fraud on the buyer. If the animal heat was not removed quickly and completely, the roundness of the intestines will be lost and the folds of the intestines will stick together. There also will be an undue amount of sliminess and an unpleasant odor which is not found in a properly chilled bird. There is, of course, always some odor when the body cavity of a bird is opened, even if it is just killed, but this odor is quite different from the pronounced smell which comes with decay. An unscrupulous dealer cannot foist bad birds on the housewife who dresses the chickens herself and knows how to interpret what she sees and smells.

The skin of a chicken will tell the housewife whether the bird has been properly "dry" picked and "air chilled" or whether it has been "scalded" in order to remove the feathers. The skin of a dry-picked chicken is flexible, translucent, with the feather papillae plainly visible and contains short hairs which have to be removed by singeing. If a chicken has been scalded the skin is hard, thick, close to the muscles underneath and almost free from these hairs. The skin of a dry-picked chicken which has been chilled in water has lost the powdery look which is characteristic and is shiny, thicker than when air chilled, and it is scarcely possible to see the pink muscles underneath as one should be able to do. A water chilled chicken is also a fraud to the buyer, because it absorbs water, which is charged for at chicken prices.

Housewives should insist on a dry-picked chicken, because any wetting of a chicken, and especially scalding, lessens or destroys the delicate flavor of the meat.

CONTROL OF CHICKEN MITES

Replying to an inquirer from Congress, Arizona, who asks about a remedy for chicken mites and ticks, Prof. G. W. Barnes, farm adviser on livestock of the agricultural extension service of the university of Arizona college of agriculture, recommends the following powders and sprays:

Formula 1—Three parts gasoline, one part crude carbolic acid, 90-95 per cent strength. (Do not use crude carbolic less than 90-95 per cent strength.)

Formula 2—Three parts gasoline, one part cresol. Mix the gasoline and crude carbolic acid together or if cresol is used instead of crude carbolic mix very thoroughly; add gradually while stirring plaster of Paris to take up all the moisture. It will require about four quarts of plaster of Paris to one quart of liquid. When enough plaster of Paris has been used the mixture should be a dry pinkish brown powder, having a combined carbolic and gasoline odor. Sprinkle well into the feathers.

For a spray to be applied to the roost, boxes and walls, you may use three parts kerosene and one part crude carbolic acid, 90-95 per cent strength, or if the 90-95 per cent crude carbolic acid cannot be obtained, cresol may be substituted. Stir thoroughly and apply with brush or spray pump.

It would be well also to rub the chickens' heads with vaseline and sulphur.

THE FOWL'S DIGESTIVE SYSTEM

The following description of the digestive system of a fowl is given by a farmers' bulletin of the department of agriculture of New South Wales, Australia: In man digestion begins in the mouth, where the food is begins in the mouth, where the food is masticated and mixed with the saliva. In fowls the system is different, there being very little saliva, and it is thought the tongue is of small use as an organ of taste and assists in swallowing only. About half-way down the gullet is the crop which is a sort of reservoir for feeding the stomach. Below this, the gullet, or oesophagus, opens into a glandular stomach termed the succentric verticle; the food here gets mixed with the gastric juices, and proceeds then to the stomach, or gizzard, where the food is ground by the grit therein to a fineness enabling it to be acted upon by the digestive juices. From the gizzard the masticated food proceeds into the first section of the intestines, the duodenum, where it is transformed into a more digestive substance. Between the sections of the intestines lies a glandular body, the pancreas, which secretes a digestive fluid, its duct opening into the intestines, where the juices are mixed with the already digested food. Opening also into the duodenum, at the back of the pancreatic ducts, is the canal of the gall sack, by which the bile is secreted and emptied into the intestines. This also assists in promoting muscular action of the intestines, whereby the food is forced onwards, either to be absorbed by the blood or voided as waste. The liver has several functions. It plays an important part in the purification of the blood; it secretes bile, supplies heat to the body, etc. The spleen is a wine-colored, disc-shaped body, lying at the right side of the stomach, but the part it plays in the physiology of poultry is not known. The small intestines consist of a number of convolutions, in which the food undergoes further changes. The portion of the intestine extending from these becomes larger in size, and is known as the rectum, and opens into the vent.

UP-TO-DATE STOCK ADVERTISING

We have received from Willowmoor Farms, Redmond, Washington, lithograph showing in colors general view of the farm, also a string of very fine Ayrshires, for which the farm is noted. The farmer, especially the stock grower, is learning that up-to-date advertising has as great value for him as for the merchant or manufacturer.

COMFORTING

It was after the distribution of prizes at a Sunday school.

"Well, did you get a prize?" asked Johnny's mother.

"No," answered Johnny, "but I got 'horrible mention.'"—Ladies' World.

HAD A GOOD EXCUSE

Mother—Tommy, if you're pretending to be an automobile,. I wish you'd run over to the store and get me some butter."

Tommy—I'm awful sorry, mother, but I'm all out of gasoline.—Judge.

"It is the duty of every man and woman to be married at the age of twenty-two," said the lecturer.

"Well," said a woman of thirty, with some asperity, "you needn't tell me that. Talk to the men."—Philadelphia Ledger.

RABBITS

New Zealand Reds—Scored and sold on merit. Investigate. Our Catalogue is free. Caldwell Bros., Los Angeles, Cal., Box 613.

Irrigation Forestry

THE FUEL VALUE OF WOOD

THE fuel value of two pounds of wood is roughly equivalent to that of one pound of coal. This is given as the result of certain calculations now being made in the forest service laboratory, which show also about how many cords of certain kinds of wood are required to obtain an amount of heat equal to that in a ton of coal.

Certain kinds of wood, such as hickory, oak, beech, birch, hard maple, ash, elm, locust, longleaf pine and cherry, have fairly high heat values, and only one cord of seasoned wood of these species is required to equal one ton of good coal.

It takes a cord and a half of shortleaf pine, hemlock, red gum, Douglas fir, sycamore and soft maple to equal a ton of coal, and two cords of cedar, redwood, poplar, catalpa, Norway pine, cypress, basswood, spruce and white pine.

Equal weights of dry, non-resinous woods, however, are said to have practically the same heat value regardless of species, and as a consequence it can be stated as a general proposition that the heavier the wood the more heat to the cord. Weight for weight, however, there is very little difference between various species; the average heat for all that have been calculated is 4600 calories, or heat units, per kilogram. A kilogram of resin will develop 9400 heat units, or about twice the average for wood. As a consequence resinous woods have a greater heat value per pound than non-resinous woods, and this increased value varies, of course, with the resin content.

The available heat value of a cord of wood depends on many different factors. It has a relation not only to the amount of resin it contains, but to the amount of moisture present. Furthermore, cords vary as to the amount of solid wood they contain, even when they are of the standard dimension and occupy 128 cubic feet of space. A certain proportion of this space is made up of air spaces between the sticks, and this air space may be considerable in a cord made of twisted, crooked and knotty sticks. Out of the 128 cubic feet a fair average of solid wood is about 80 cubic feet.

It is pointed out that heat value is not the only test of usefulness in fuel wood, and since 95 per cent of all wood used for fuel is consumed for domestic purposes, largely in farm houses, such factors as rapidity of burning and ease of lighting are important. Each section of the country has its favored woods and these are said to be in general the right ones to use. Hickory, of the non-resinous woods, has the highest fuel value per unit volume of wood, and has other advantages. It burns evenly and, as housewives say, holds the heat. The oaks come next, followed by beech, birch and maple. Pine has a relatively low heat value per unit volume but has other advantages. It ignites readily and gives out a quick hot flame, but one that soon dies down. This makes it a favorite with rural housekeepers as a summer wood, because it is particularly adapted for hot days in the kitchen.

The fuel qualities of chestnut adapt it particularly to work in brass foundries where it gives just the required amount of heat. Coastwise vessels in Florida pay twice as much for Florida buttonwood as for any other because it burns with an even heat and with a minimum amount of smoke and ash.

The principal disadvantage of the resinous pines is their oily black smoke.

FARM ANIMALS

"Farm Animals," a book covering the general field of animal industry by Thomas Forsyth Hunt, dean of the California College of Agriculture, and Charles William Burkett, editor of The American Agriculturist, published by Orange Judd Company, at $1.50.

"In preparing 'Farm Animals' the authors have sought to treat in detail not merely the subjects of breeds, breeding, feeding, sanitation, medication and animal products, but to cover the whole field of animal industry. They have followed the general plan as developed in 'Soils and Crops,' the initial and companion volume of this series. By means of the two books a full teachable course covering soils, crops and animals is now available for use in the schools. Each of these books is complete in itself in its field. No collateral reading has been suggested for pupils, not because the authors wish to discourage such independent effort on the part of the pupil, but because they believe they have included as much subject-matter as can be covered wisely in 16 weeks by pupils of high school age."

While in a sense this is a school text book and its 48 chapters are called "lessons," yet there is a lesson in every one of them for the farmer who would keep in touch with modern-day agriculture. The lessons start with sorting of animals, animals made useful, relation of animals to man, plants and animals, food nutrients, scientific terms in feeding, how food is digested, and so on through feeds; draft horses and speed horses, explanation of how they move, breeds, dairying, beef, sheep, hogs, goats, bees, and even fish, on the farm. The closing chapters have to do with diseases and keeping animals healthy, farm butchering, marketing and an appendix. Of course there is a good index, which is one of the most valuable features of every reference book.

THE LURE OF THE LAND

We have a letter from the Century Company in which it refers to the fact that Dr. Harvey W. Wiley has written a new book. It is "The Lure of the Land," and contains much good advice for the man or woman tired of city life, and much interesting reading for the farmer. In the book Dr. Wiley discussess agriculture, a learned profession, the born-on-the-farm myth, the dairy, the hope of the small farmer, the farmers' market, the farmer and the parcel post, the decreasing meat supply, Uncle Sam's big farm, etc. It will be issued soon.

Orosi, Tulare County, will hold a farmers' institute January 22-23. There will be lectures and demonstrations of pruning, stock judging, etc.

"I Saved $400.00 on My House and Barn by Buying Building Material from the Whiting-Mead Commercial Co."

This is an actual statement made by one of our customers. You can do the same. You can save from $25.00 to $40.00 on every hundred dollars' worth of building material you need by buying direct from us. We cut out the dealer's profit. If you are going to build or repair a house, barn or auto shed—study these prices carefully and be sure to send coupon below for our Big Free Catalog.

THIS SPECIAL STEEL ENAMEL BATHTUB

A wonderful bargain! Made of finest galvanized 24-gauge steel. Outside finished with a rich sky-blue enamel, bronze trimmed. Price only $8.00

Others larger in size at $8.50, $9, $10. Just the thing for your house.

Low Down Enamel Steel Toilet Combination..... $12.50
Complete to floor—wonderful value.

Low Down Vitreous China Closet Combination..... $16.00
Special value—worth $22.50.

Big values in High Tank Toilet Combinations..... $10.00
Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks. All sizes—up from..... $1.00

Best Quality Porcelain Lavatories; every one guaranteed—$10 down to... $3.75

Standard House Paints. High grade—24 colors—per gal..... $1.50

Black Graphite Roof Paint—per gal..... 50c

Standard Roof Paints—red, green, gray—per gal..... 85c

Shingle Stain, made from pure ground colors—per gal..... 50c

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you. Weship direct.

ROOFING PAPER—1-ply, plain or sanded—per roll of 108 sq. ft... $1.25

—2-ply only $1.50 per roll. Cement and nails ready to lay included in above price. Send for free sample.

WIRE FENCING at Half Price—per rod..... 35c

Extra heavy Field Wire, 6-inch galvanized mesh. Perfect condition; 55 inches high, 20 rods to the roll. This is just about half price. Don't pass up this big opportunity. Send us your order, your money back if you are not satisfied.

GALVANIZED BARB WIRE—per roll of 80 rods..... $1.75

Our Light Wire Special, slightly water stained in shipping otherwise in perfect condition.

Special heavy galvanized "Waukegan" barb wire, 80 rods to reel, weighing 100 to 115 lbs., only $2.75 per 100. Going fast! Don't miss this opportunity.

Lowest price yet on CORRUGATED GALVANIZED IRON—per hundred square feet..... $3.55

Look at this! Corrugated galvanized iron, 2-inch corrugattions, from 6 ft. to 10 ft. long. This is in perfect condition and won't last long at this special price.

WALLBOARD

The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.

Cheaper and neater than plaster or lumber, and any one can install it in one-quarter of the time. Per 1000 square feet..... $19.00

This is a $30.00 Value.

Special—NAILS—in 100-lb. kegs—per keg..... $2.20

This is an unequaled price for 20, 30, 40, 50 and 60 penny common nails. We also carry all sizes and finishes at $2.20 per 100 lbs. base.

LUMBER, SASH AND DOORS — Lowest Prices on Rough and Finished Lumber

2-inch Redwood as low as $12.00 per 1000. 1 in. x 6 in., 8 in. and 10 in. length, 8 to 18 ft., going at $15.00 per 1000. 8 ft. x 12 ft., galvanized all-metal frame skylights glazed with ribbed glass, suitable for hot-house, roofs, etc., crated, $12.00 each.

Two-light double hung windows 1⅜ in. thick, best quality American window glass, all sizes..... 60c

No. 1 Colonial Door Selected Kiln-Dried Oregon Pine — all stock sizes—$1.50 up.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Blue Gum Fence Posts

Can blue gum, especially two-inch growth which is coming up from stumps, be used for posts, and how may they be treated so they will last? Is crude oil good for this purpose?—N. D. E., Del Rey.

After cutting allow the posts to thoroughly season, then dip in hot creosote. This will extend the life of posts many years. We have seen posts six inches in diameter, which were cut and set in the ground green, become like punk in two years. Brush treatment is not satisfactory, nor is the crude oil as efficient as creosote. Whichever is used, it should be hot, then immerse that portion of the posts which will come in contact with the earth and allow to remain in the solution until it cools to the temperature of the atmosphere. If the method of applying creosote over surface with a brush is followed as it is at times, have the creosote hot and make two applications, but great care must be used to soak the creosote into all checks, knot holes or other defects. By this method there is but very little penetration, but if a perfect surface covering is given it will very materially extend the life of such posts. It must be borne in mind that posts must first be thoroughly seasoned, for if not the moisture within will cause large checks after the dipping is done and these will admit moisture to the center and their life will be materially shortened. Brushing creosote over green poles is of practically no value.

Olives

What is the outlook for products of olive trees? What are the best varieties for pickling and for oil? Can olives be propagated from cuttings, and how is it done?—N. D. E., Del Rey.

There will always be a demand for good olives and good olive oil and we trust the price will remain as satisfactory as it has been during the last two or three years. The removal of the tariff has admitted large quantities of foreign-made oils, but even with all southern Europe shipping to this country there would be a demand for all that California can produce in addition. The best variety, or at least that which is most generally planted, is the Mission. We would recommend planting only such varieties as are best for pickling, then in grading any inferior fruit may be sent to the oil mill while the choicer fruit will be in line for good prices for pickling purposes. There are many strains of the Mission olive and one should see the trees from which he is going to take cuttings. If they are taken from a tree of the larger, better bearing strain it will be well. They may be propagated from truncheons or hard wood cuttings ten to fourteen inches long. They may also be propagated more rapidly in glass houses or hot bed where the smaller herbaceous cuttings are used. Mr. Mills gives complete instruction regarding both methods in an article published in the issue of the Cultivator of December 21, 1911.

Pure Bred

Am breeding ordinary heifers to pure bred Guernsey bull. How near to pure bred can I get the offspring and in how many generations? Will change sires at each crossing. How distantly related should the sire be to insure vigorous offspring?—Subscriber, Tulare.

Assuming that a pure bred bull is used each time, the fourth generation will have 15-16 pure blood and 1-16 mongrel. From this it will be seen that for practical purposes a very few generations will give a comparatively pure bred animal. For breeding for registry a thousand generations would not suffice, even if the male was always registered stock. The matter of relation of sire to offspring is a long one which it is impossible to discuss in these columns, for the matter of line breeding is one involving volumes in its discussion. There are many cases where vigorous offspring has been secured where sire has been bred directly to daughter.

Planting Bamboo

What time of the year is best to transplant bamboo and how should it be reset? We wish especially to keep the tall growth from dying.—Subscriber, Gaviota.

After May is perhaps best. We have reset them as late as August, but they seldom get established so as to start new growth before the cool season and then if frost comes it is reasonably sure to catch them during the winter. The only way to reset and preserve the tops is to take up with a large ball of earth. As there are many fibrous roots this is comparatively easy unless the clump is to be subdivided. Taken up with a large ball one may reset at the present time for there is then no great shock to the plant. In fact, we saw hundreds of them which have been planted on the world's fair grounds at San Francisco within the past few weeks and these were all brought from Japan. Where the clump is subdivided we presume May and June would be the better months.

Best Crops

I would like to ask as to best fruit or other crop to plant on my ranch near Garden Grove in Orange County. Have been advised to plant Bartlett pears with Muscat grapes between. Are pears profitable in this particular locality? Also, how about apricots and plums or figs?—Subscriber, Los Angeles.

With water close to the surface, which is usually the case in that section, and soil conditions rather heavy, the planting of fruit is somewhat restricted. Owing to your altitude being rather low, it will perhaps not be best to try Bartlett pears. In the southern end of the state they do better on higher land. Perhaps the best crop for your particular section would be chili peppers. The locality is particularly adapted to that crop and it has proved successful there. Regarding culture of this plant in the Garden Grove district Mr. J. B. Neff advises:

"I do not recall the exact location of this land, but if it is not too heavy adobe the inquirer will likely do better by growing chili peppers than any other crop, as that locality is particularly well adapted to peppers. I would advise a dressing of eight to ten tons

of stable manure to the acre each year as soon after the crop is gathered as it can be put on, and in addition would sow broadcast about 400 pounds of superphosphate, having 17 to 18 per cent available phosphoric acid, to each acre. Then have the land well plowed and have it cultivated several times before planting time. Get the chilis in as early as can be done to escape late frost, and I believe it will prove more profitable than by planting fruit trees.

Diphtheretic Roup

What is the matter with my chickens and turkeys? They get so they can't swallow. They eat as though they were starved but the food stays in the throat until they spit it all up. I opened the throat of one after it died and it was white and smelled bad. They hang around until they starve to death. There seems to be a lump in throat so the food doesn't go by it.—Subscriber, Inyokern.

I am afraid your birds have diphtheretic roup, a very serious disease and difficult to cure. The most common remedy is peroxide of hydrogen. Make a swab with a piece of absorbent cotton and stick, and paint the grayish patches in the throat with peroxide diluted with an equal quantity of water. Do this daily till there is improvement. Dr. Salmon recommends common salt, two drams in a quart of warm water. Dip the swab in this solution and gently rub the false membranes till they are loosened from the underlying tissues. After the false membrane has been removed, moisten another swab of cotton in a two per cent solution of lysol or carbolic acid and apply for a minute or two to the diseased surface. Another solution which may be used consists of 35 grains of chlorate of potash and two grains of salicylic acid in an ounce of water, with an ounce of glycerine added. This may be applied to the spots three or four times a day. It is absolutely essential that all sick birds be removed from the general flock and placed in sunny, well-ventilated coops, either indoors or where they are well sheltered from the wind. It would do no harm to give all the birds, sick and well, a little permanganate of potash in the drinking water. Examine the feed and litter for mold and look well to sanitary conditions.—J. A. K.

San Jose Scale

I submit twig of plum tree which is troubled with some disease. What is it and what is the remedy?

This is nothing more nor less than a severe infestation of San Jose scale. The best remedy for this is lime sulphur wash. Apply at once or while the trees are dormant at the rate of about one part to ten or eleven parts of water.

Worms

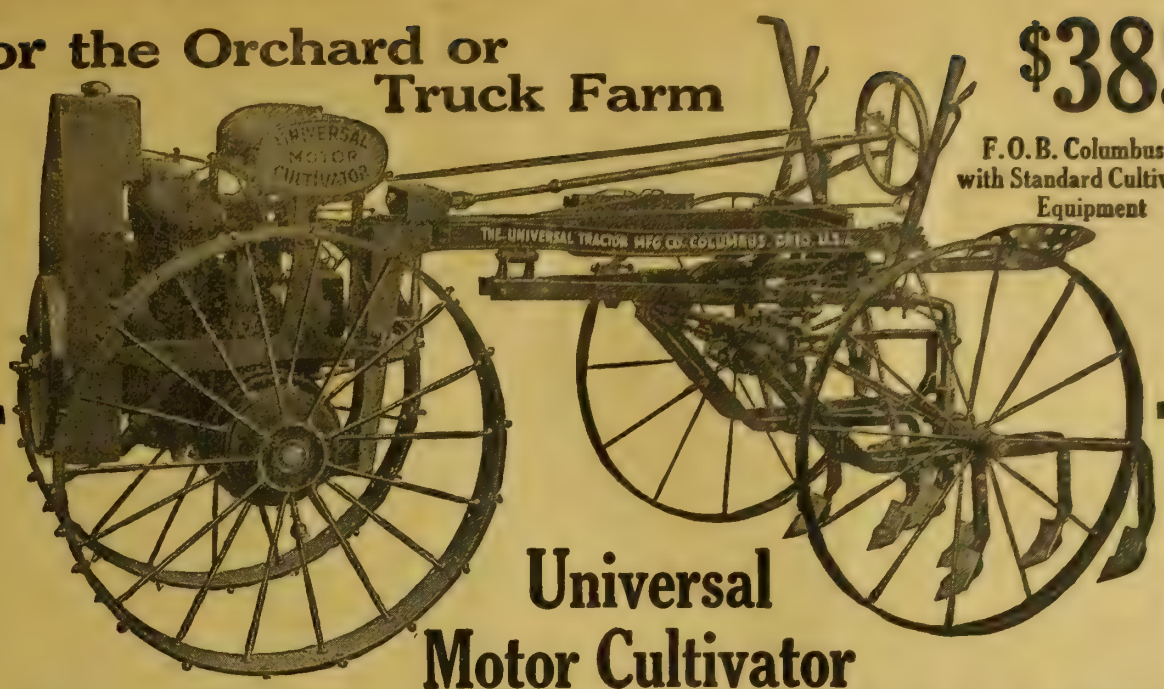
Replying to a query as to treatment for worms in chickens, Mrs. Koethen writes:

"It is said that worms often inhabit the intestines of chickens without affecting the health of the birds, and it is only when for some reason they become very numerous that treatment is needed. If very many birds are affected I should consider it an indication that it is time to move to clean ground. If the soil they are on is full of these worms it is impossible to get rid of them in any other way. One of the best remedies for worms is oil of turpentine which should be given when the birds are fasting. Give a very light feed at night and give the medicine the fol-

For the Orchard or Truck Farm

$385

F.O.B. Columbus, O., with Standard Cultivator Equipment



Universal Motor Cultivator

Developed from the Modern Light Automobile—Not from the Heavy, Crushing Traction Engine

Costs Less than a Good Team

YOU need take no chances on crop failure through neglect. By changing shifts among men or boys you can get into the corn, cotton, tobacco or small truck and stir the ground from 16 to 24 hours a day at the rate of an acre an hour and at an average fuel cost of but three-fifths of a gallon of gasoline per acre. And when not at work there is no upkeep cost.

Tried and Proven Mechanical Principles

From the long stroke, 10-horsepower motor to the latest worm gear transmission every part of the machine is an adaptation from the automobile and the motor truck applied to field work.

Has 3½ inch bore, twin cylinder, long stroke motor, automatic lubrication by plunger pump, automatic thermosiphon radiator, Holly carburetor, automatic governor to take care of the changes in load, Atwater-Kent ignition, worm gear transmission running in oil bath, expanding ring clutch, one speed—forward and reverse, develops 10 to 12 h. p. on brake [equal to pulling power in the field of an ordinary team], weighs 1000 lbs.

The Only Tractor That Cultivates

It enables you to get into the field any time and cultivate as fast or slow as you want to go. Get the quick dust mulch after rain that means crop salvation. Work in the field every one of the 24 hours if you wish, when the work crowds.

It Cultivates corn, cotton, potatoes, kaffir, sorghum, sugar cane, federita, tobacco, tomatoes, garden truck, orchards, vineyards, etc.

It Pulls mower, rake, spike tooth harrow, drag, rollers, small disk harrow, cultivators of various kinds, weeders, etc.

It Plants corn, cotton, sorghum, clover, alfalfa, potatoes, garden truck, etc.

It Operates pump, wood-saw, feed grinder, corn sheller, washing machine, churn, electric light plant, or any other light appliance of the modern farm.

Send for the Book

Let Us Show You how to get into the corn and double your efficiency in corn plowing time. If you are an orchardist let us explain the machine's fine orchard work. Whatever your class of work, we want you to send for the free book.

FITZGERALD & CO., 880 F. Street, Washington, D. C.

lowing morning before they are fed. Mix the oil of turpentine with an equal quantity of olive oil and give a dose of 20 to 30 drops to each bird. After two hours follow the turpentine with two to three teaspoons of castor oil. An hour later a light feed may be given. Santonica or worm seed in doses of seven or eight grains is also recommended as a remedy for round worms, and powdered areca nut, 30 to 40 grains to a dose, is especially successful in treatment of tape worms. Whatever remedy is used it should always be followed by castor oil or epsom salts. I think your birds have round worms but cannot be sure from the description given. Tape worms are in segments which can usually be found in the droppings when the worms are present.—J. A. K."

Whitewash for Poultry

Please give effective and cheap white paint or whitewash for poultry houses. Wish it to be free of lumps so as to run through spray pump.—Subscriber, Santa Cruz.

Martinez Nursery

Established in 1884

T. S. DUANE, Prop., Martinez, Cal.

All leading varieties of fruit and ornamental trees.

GRAPES, ORANGES and LEMONS.

$1.65 worth of Native Shrubs for $1.00

Cascara (Rhamnus California), Christmas Berry (Heteromeles Arbutifolia), Wild Cherry (Prumus Ilicifolia), Wild Lilac (Ceanothus), Rhus Integrifolia.

(Send money or stamps)

Native shrubs beautify foothill or canyon property and can be grown where other shrubs do not do well. They require very little care or water.

We are growers of all kinds of nursery stock, shrubs, trees, etc.

Send us a plan of your grounds and we will make suggestions regarding the landscaping.

Our catalog is free—write for it.

IRVING N. WARD NURSERY

SIERRA MADRE, CALIFORNIA

We would refer our subscriber to the issue of the Cultivator of January 7, 1915. To run through spray pump screen or strain the wash after it is made through fine copper mesh sieve.

Winter Irrigation

In the issue of the Cultivator of January 7, I note an article entitled "Winter Irrigation" in which the theory is advanced that if the soil is soaked deep enough for the irrigating water to reach the underground water it will cause the latter to rise higher. Is it a fact that this procedure will raise the level of the underground water and, if so, to what extent? The water level in this section is from 28 to 30 feet and the moisture rises to within about 20 feet of the surface. Would it be of any material advantage to wet the ground down to moisture?—Subscriber, San Bernardino County.

We do not believe the thorough soaking of soil in the winter until surface moisture meets water level will "bring up" any of the lower moisture but if there should be deficient rainfall this thorough soaking does saturate the soil down to water level and roots have opportunity to make deeper penetration. Then thorough cultivation holds the surplus moisture much later in the summer.

Six Weeks Beans

Please name the beans enclosed. Will they thrive in the San Gabriel Valley in Los Angeles County?—Subscriber, Eugene, Oregon.

It is almost impossible to be certain of the variety of any beans for they grow in such infinite varieties, but with little question this is the bean known as Six Weeks and it does well in the San Gabriel Valley.

Pest of Dogs

A neighbor has three dogs which prove a nuisance on our place by scratching or digging up the garden, destroying many vegetables, and in addition the dogs have been known to bite and do injury. I also have a female dog and the neighbor having the three dogs threatens to make me get rid of it. Is this possible and is there any way of controlling the others?—Subscriber.

There certainly is no way in which anyone can be made to dispose of any well-dispositioned dog. We presume the neighbor's dogs would come under the ordinary trespass law, which however provides that unless one's property is surrounded by a "substantial fence" no damage can be collected for injury done. If these dogs are known to bite or in any way be dangerous the law of common nuisance will apply and the authorities should be able to at least force them to be muzzled and kept within bounds.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Partnership

A and B are in partnership on a ranch. B works the ranch while A furnishes the capital. The ranch is being bought on contract. B has the contract in his name. A has a contract from B for half interest. In case A should become involved in debt could his creditors attach the whole of the ranch? The contract calls for an undivided half interest. Where would there be any danger to B from A's creditors?—C. N.

If the contract of B alone is recorded, A's creditors would be obliged to prove that A had an interest in the property. If both contracts are recorded A's creditors could sell out under execution sale the interest of A in property.

Making Will

Have willed property to minor son. In case we both die would property go to his mother, who was divorced from me? Property was bought after our marriage.—Subscriber, Santa Cruz.

Unless your will should provide for a reversion to some other person, in case of death of your son prior to his arrival at the age of 18 years, the estate in case of himself and you would revert under succession to his mother, but as stated, this can be avoided by proper provision in the will.

Mistake in Survey

A and B own adjoining land, which was surveyed and a line established 25 years ago. A has had his land under fence most of that time. Now B has had his land surveyed and claims the line runs over on A 200 feet. If the surveyor made that mistake can B take the 200 feet from A after 25 years of undisputed possession?—Subcriber.

Cases of boundary mistakes lie so largely in evidence that it is difficult to give a definite answer. There have been cases in this state similar to this, amounting to 16 years undisputed possession, wherein it was held that by reason of acquiescence in the boundary line of fence parties could not thereafter show there was different boundary, but acquiescence is based upon facts of each case.

To Collect Board

A is working on public works and boards with B. Bill has been sent him, but he does not pay. What procedure should be taken to collect same from wages?—Subscriber.

In order to hold moneys due debtors from a city, county or state, it is necessary to procure a judgment and file transcript of such judgment with the auditor, together with affidavit stating the exact amount due at the time of the filing.

Tax Exemption

How much tax exemption is allowed a soldier that served in the Spanish war? When does the law on not paying poll tax go into effect?—Subscriber, Sierra Madre.

Property to the amount of $1,000 of a resident of this state who has served in the army, navy, marine or revenue service of the United States in time of war and received honorable discharge therefrom or if he has not such an amount of property in his own name, then that amount in the name of his wife is exempt from taxation; unless such discharged soldier or his wife owns property of the value of $5,000. The constitutional amendment abolishing poll tax went into effect the 26th of December and eliminated the poll tax assessable the first Monday in March, 1915.

Water Rates

Am a stockholder in an irrigating company that also furnishes domestic water direct from its underground irrigating mains. To most of its stockholders it makes a flat rate of $1.00 per month to domestic users, but to some consumers the supply is metered and they are charged $1.00 up to the first 10,000 gallons and $1.00 additional for each additional 10,000 gallons. Is such discrimination legal? Can the meter users compel the company to either meter all customers or else eliminate meters?—Subscriber.

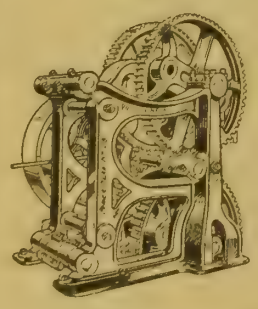
A corporation organized to deliver water solely to stockholders at cost and no one else is not a public utility, but otherwise it is a public utility and is subject to regulation by the railroad commission. It would seem that the company above named is a public utility, in which case the above differing rates would constitute a discrimination and could be regulated by the railroad commission upon application filed therefor.

Filing on Power of Ditch Water

I have a ditch running through my place in which I have no right except what I may have through appropriation for stock. This ditch is really an old creek used now for irrigation. It flows through my yard and, having considerable fall through my land, I am considering filing on it for power purposes. I would like to know if that can be done and if so how it should be done. Should I file on a certain number of inches? Can I then hold that number of inches should the users decide to turn the water off? I have lived here for over two years and have never seen it dry except once for a day or so. I would like to install a small power plant and don't like to go to the expense until I am sure of the water.—Subscriber, Bishop.

If the appropriators for irrigation have either abandoned the water flowing through your land or have turned it into this creek to waste, you would be entitled to appropriate the said water for power purposes. As you are claiming for electrical power it would be necessary for you to procure a permit from the water commission, which will cost you not less than $25; at the same time it would be wise for you to petition the water commission to ascertain the relative rights of the claimants to this stream. The commission will thereupon take testimony and give judgment, which would settle the rights of appropriators. A person desiring to appropriate water must post a notice in writing in a conspicuous place at the point of intended diversion stating that he claims the water to the extent of a given number of inches measured under a four-inch pressure, the purposes for which he claims it, the place of intended use, the means by which he intends to divert it, and the size of the flume, ditch or pipe. A copy of this notice must within ten days thereafter be recorded in the office of the county recorder and within 60 days after posting of notice claimant must commence the construction of the works by which he intends to divert the water.

Pomona Deep Well Pumps



—are built on strictly mechanical lines, provided with twin "stepped" gears, with two bearing faces, machine cut, and by our new "Walking Beam" motion; the up-stroke, or working stroke, is a slow, almost absolutely vertical pull, while the down-stroke is quicker, and the slight side movement is on the down or light stroke, this feature greatly reducing the wear on cylinders, plungers and leathers as compared with the old style of plunger pump.

Write for Catalog No. 54 C —giving full information.

Pomona Circular Valves

OUR Circular Valves are the only valves so constructed as to permit the cross bar to be entirely removed, leaving an absolutely clear passage, yet when replaced, which is done instantly, are as solid as though permanently attached. Can be adjusted to allow the passage of any volume of water up to the capacity of the pipe line or stand pipe. This is done by merely turning a thumbscrew. Full details of Gates and Valves will be found in our Valve Booklet. Send for it.

Pomona Mfg. Co., Pomona, Cal.

Los Angeles Office:—930 Investment Bldg., 8th and Broadway.

The Household Department

THE FRIEND

It's not that he's obligin',
Good lookin' or a saint:
Dear God (who made him out of mud)
Knows well that's what he ain't.

He never lent me money;
He never saved my life;
An' he don't like the brand I smoke,
An' I don't like his wife.

He's not so quick an' clever—
That is, not as a rule;
At times (the times we disagree)
He seems a sort of fool.

But still it somehow thrills me
To grip his hearty hand.
I guess the thing that makes us stick
Is that we understand.

I understand the varmint;
Sometimes he savvey's me,
And that's what makes a man your pal
As far as I can see.—Charlton Lawrence Edholm.

THE PATH

ONCE upon a time there was a light-hearted girl who walked her Path. She knew it was her Path, as do all those who have asked for guidance, and she knew that it led toward Home.

The days came, as all days do, glad ones, sad ones, and some indifferently pleasant. Then when perhaps the girl herself had grown indifferently pleasant—who knows?—she became suddenly aware of a barrier placed directly across her Path—Her Path, Friend, and she couldn't understand!

At first she laughed, and called it imagination. The great gray wall that stretched up into the gray clouds was just a dream and would dissolve into nothingness.

But the wall remained.

Then she decided it was a task for her energy of will, and she bent all the force of her mentality to demolish the hindrance to her way.

But the wall was still there.

Fear crept into her heart, but she brought high courage to bear. She forced a sort of peace into her mind and said, "I admit the Wall, but there must be a Door Out." So she searched until the shadows fell and engulfed her in their grayness, and she was one with the gray sky, and the hard gray wall.

But the wall still towered to infinity.

Then terror overcame her. With clenched hands she beat against the wall. Her body was bruised and torn from head to foot. * * * And her heart was broken.

But the wall had not moved.

Days passed and days came again, and still she lay, body-conquered, soul-daunted. But because she was close pressed against the earth, crushed into a sense of oneness with earth-sorrow, she found she was not alone.

Then, girl no longer, she arose, ready for her woman-part in the world. Thankful if she could bring a smile to a sad face, glad when little children ran to her.

And lo! when the mists of self-seeking cleared from her eyes, she discovered no miracle, but a simple fact: The wall was still there, but it indicated only a sharp turn in the Path. The way was still open.

The way had never been closed.

And the woman, filled with a quiet joy, turned and followed her Path.—C. N. B., Grand Traverse Herald.

FEBRUARY PRIZE CONTEST

For recipes telling how to use potatoes and potato flour in breads, cakes, etc.: $2.00 for best, $1.00 for second best, six months' subscription for all others published. We are hearing much these days about the advisability of using potatoes where possible to substitute for wheat, which is soaring out of sight owing to war prices. European governments are reported to be urging their people to eat bread made half of potatoes. If you have not already experimented with potatoes as a substitute for wheat flour do so this week and send the Cultivator the recipe you have found most satisfactory.

The modern cook, of necessity and of choice, stays not in the beaten paths. She makes carrot plum pudding and flavors soup with green almonds. Let us all join the ranks of the discoverers.

Recipes should be in this office by the morning of Thursday, February 11. Write on one side of paper only. Send name of member of your family now receiving the Cultivator that the six months' extension of subscription may be credited to that name.

THE TOLL ON LIVING COST

Distribution expense is a big item in the present high cost of food products. Here is an illustration: A housewife in the city, living a mile and a half from her grocer, steps to the phone.

"Central, two, four, three, please."

"Smith's grocery? Please charge and send me 10 cents' worth of animal crackers. Pick out the elephants—the baby is afraid of them. Get them up right away."

Talk about high living cost! If the consumers of today would apply common sense judgment in their demands on the middlemen who serve them, they would get food cheaper. Of course, there are always some who think they must have this kind of useless and expensive service, and who are willing to pay for it. But they are not the ones who complain the loudest. It is those who cannot and should not afford such a toll on living cost who are continually berating the producer. If they would look nearer home, they might discover some of the real causes of high prices which they are now overlooking entirely.

SAVING HIS ENERGY

"Yes," said the man just back from the West, relates the Pathfinder, "when I went to Montana I did what nearly every other tenderfoot does—bought one of those broad-brimmed felt hats like the ones stage cowboys wear, and put it on at the first opportunity.

"Mine wasn't the only one in town, but I felt conspicuous just the same. Somehow or other I hadn't acquired the knack of wearing it. One windy day—and, believe me, it can blow some in B——, without half trying—I walked down the main street of the town holding onto my hat with one hand and my coat with the other. As I turned a corner the wind seemed to stop blowing, and I let go of the hat, when a sudden gust came, took it off my head and sent it rolling like a frightened hoop down the street.

"I started to give chase, when another hatless man—he was a sure enough Westerner, too—took me by the arm and said:

"'Don't chase it, pardner; there'll be another one along in a minute.'"

CROCKERY

Quickly Made Clean and Bright by the Use of

Large Sifter Can, with Full Directions, 10c

Bring up a Girl—

Along lines that will develop her into a robust woman. Give her Ghirardelli's Ground Chocolate. No fear of harmful after effects. It combines all the elements which growing girls require, and it has a taste that every child likes. Every mother should serve it because of its purity, its wholesomeness and the ease with which it may be prepared. Costs less than a cent a cup.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

Candy Recipes

A New Divinity Candy

Three cups granulated sugar, two-thirds cup water, one-third cup honey, whites of two eggs, one-half dozen figs and pinch of salt.

Bring sugar and water to boiling point, then add the honey. Boil until it spins a thread when dropped from a spoon, then pour slowly over the beaten egg whites, beat a couple of minutes and add the figs cut up fine. Beat hard until it begins to granulate and pour quickly into buttered tins. Later it can be cut into squares.—Mrs. Glenn D. Smith, Ontario.

Pink Divinity

Two cups of sugar, one-half cup of white corn syrup, one-half cup of hot water. Cook until quite brittle when tested in cold water.

Pour slowly over the stiffly-beaten whites of two eggs. Color pink, and beat until it begins to harden. Add one-half cup of preserved cherries cut into small pieces, and flavor.

Spread on buttered plates, and when cooled cut into squares.—Susan May Pinkerton, Santa Paula.

Honey Foam

Three cups granulated sugar, one-half cup strained honey, two-thirds cup water. Boil until a firm ball can be made when tested in water. Have ready the whites of two eggs beaten very stiff, and add gradually the boiling syrup. Beat until quite stiff then add a cup of seedless raisins and pour into a buttered dish.—Mrs. C. H. Weed, Porterville.

Loaf Candy

Three pints white sugar, one and one-half pints cream, one pint light colored syrup, one quart nuts, one teaspoon vanilla. Cook until it forms a soft ball when tried in cold water. Take off of fire and beat hard until it begins to get cold, then pour the nuts in and beat together. Pour into a deep pan so it will make a loaf. You will find this is a delicious candy and will keep for months.—Mrs. J. H. Paul, Eagle Rock.

California Pralines, a Southland Dainty

One pound brown sugar, water to dissolve. Boil till nearly brittle, then add one cup of cream, let boil up again and add juice of one orange, boil again and add one tablespoon of butter. Beat like caramels and pour over one pound of English walnut meats and grated rind from the orange. Beat to a cream, then drop small pieces on greased pans to harden. Glucose or corn syrup may be used with the sugar to insure smoothness.—Mrs. E. Carrithers, Laguna Beach.

Turkish Delight

One ounce gelatine, one-half cup cold water, two cups granulated sugar, one-half cup boiling water, grated rind of one orange, juice of one orange, juice of one lemon, one-half cup chopped nuts, fruit coloring if desired.

Add cold water to gelatine, let stand until dissolved. If sheet gelatine is used break in pieces before adding cold water. Put sugar and boiling water in saucepan, bring to boiling point, add gelatine and let simmer 20 minutes. Add coloring if desired. Strain, add nut meats and turn into pan rinsed in cold water. Let stand until cold, remove to board, cut in cubes and roll in powdered sugar.—Josephine Herrick, Colton.

California Creams

Three cups white sugar, one and one-half cups water, one cup walnut meats, lump butter size of walnut, one teaspoon vanilla flavoring. Put sugar in a pan over a slow fire, let it melt and brown a light brown. Watch closely as it must not burn. Add the water and butter. Boil this, without stirring, to the soft ball stage, remove and stir until thick and creamy, adding nuts and flavoring. Turn into a platter and mark into blocks.—Mrs. S. D. Teel, Santa Ana.

Delicious White Nut Candy

Two cups granulated sugar, two cups of milk, one-half cup butter, three-fourths cup chopped English walnut meats, one-half cup chopped figs, one tablespoon vanilla or almond extract. Put the milk, butter and sugar into a saucepan by the side of the fire until the sugar is nearly dissolved. Then boil until the syrup forms a hard ball when tested in cold water, or 250 degrees by a candy thermometer, then take the pan from the fire, add the chopped nuts, figs and extract and beat until the mixture begins to get sugary. Pour at once into buttered tins. Mark into squares with a knife, and when cold break into pieces.—Anna Moss Keyes, Lakeside.

Walnut and Date Loaf

Three-fourths cup of water, two cups of sugar, one-fourth teaspoon of cream of tartar, vanilla.

Directions: Put the sugar, cream of tartar and water in a saucepan and stir thoroughly. Then boil the mixture without stirring until it forms a soft ball in water. Remove from fire and pour in a wet bowl and let stand until nearly cool, then beat with a spoon to a soft creamy mass, knead with the hands until it is soft and smooth and mix in the vanilla. Have cut up in small pieces a cup of walnut meats and dates mixed, and knead into this fondant. Then cut into slices.—Mabel Peterkin, Orange.

Boston Loaf Candy

three and one-half cups sugar, one and one-half cups milk, one cup corn syrup. Boil until it forms a lump in cold water—not quite so hard as for taffy. Take from fire and beat until it begins to stiffen. Add nuts, cocoa or cocoanut or simply pour into buttered tin. Cut into squares when cold.—Mrs. Chas. Catlin, Saticoy.

Fruit Paste

One cup dried figs, one cup raisins, one cup dates, one cup walnuts. Put each ingredient through a meat grinder three times. Mix all thoroughly, knead with the hands and roll out an inch thick. Cut into cubes. These may be dipped into chocolate if one prefers. This fruit paste has the advantage of being not only a delicious candy but a wholesome food as well.—Caroline C. Condit, Berkeley.

Honey Fudge

In a saucepan put five tablespoons each of honey and thick sweet cream, and cook for about five minutes after it begins to boil, or until a white line appears around the side of the pan when the candy is stirred. Remove from the fire and when slightly cooled stir in a small pinch of salt and a drop or two of almond extract. Arrange in shallow oiled pans a layer of chopped marshmallows and pour the hot fudge slowly over them.—Miss Emma Gatzke, Ventura.

Sour Milk Fudge

Two cups sugar, one cup sour milk, one tablespoon butter, one teaspoon flavoring, any kind desired; one-half cup chocolate if desired, one cup nuts if desired. Let the sugar and sour milk come to boil, then put butter in and boil till it turns brown and threads in water. Take from fire, drop in chocolate and nuts and stir for a minute then pour in buttered pans and stir till cool and cut into squares.—May Blake, Ceres.

Wellesley Marshmallow Fudge

Heat two cups of granulated sugar and one cup of rich milk (cream is better.) Add two squares of bitter chocolate and boil until it hardens in cold water. Just before it is done add a small piece of butter, then begin to stir in marshmallows, crushing and beating them with a spoon. Continue to stir in marshmallows after the fudge has been taken from the fire until half a pound has been used. Cool in sheets three-quarters of an inch thick and cut into cubes.—R. Ferris, Woodlake.

Fruit Fudge—Chocolate Dipped

One and one-half cups granulated sugar, one cup maple syrup, one and one-half cups pure corn syrup, one-half cup thick cream or one-third cup milk and one-fourth cup butter, one cup of fruit—figs, candied cherries and apricots—cut in small pieces, one-half cake sweet chocolate for dipping.

Stir sugar, maple syrup, corn syrup and cream until sugar is melted, cover and let boil three or four minutes, then uncover and let boil, stirring occasionally, until when tested in cold water a soft ball will form. Remove from fire to cool. Then add the fruit and beat until it becomes thick. Pour into pans lined with waxed paper. In about 15 minutes cut into squares and dip these in melted sweet chocolate.—A. Butcher, Healdsburg.

Marshmallows

Take two cups of sugar, one cup of boiling water and cook till it forms a soft ball when tested in cold water. Soak two tablespoons of gelatine in six tablespoons of hot water. When syrup is done, add a teaspoon vanilla, pour the gelatine into it and beat steadily for 20 minutes or until it becomes stiff enough to roll out in a sheet one inch thick on powdered sugar, then put powdered sugar on top and when cool cut into inch squares and roll each one in powdered sugar mixed with one tablespoon of corn starch sifted in it.—Mrs. Nora Stronatt, Tulare.

Puffed Wheat Candy

Four cups puffed wheat, one cup sugar, one-half cup molasses, two tablespoons butter, one-eighth teaspoon salt, one-half tablespoon vinegar, one-third cup cold water.

Put wheat in shallow pan and place in oven until crisp.

Cook butter, molasses, sugar, salt, water and vinegar to crack stage. Pour syrup over wheat. Mix thoroughly, then pour in buttered pan.—Mrs. Geo. A. Grober, Cohasset, Minnesota.

Rich Caramels

Two and one-half cups granulated sugar, one and one-half cups milk, one half cup butter.

To make—Put all in a saucepan and cook. As soon as it boils well add very slowly one cup sugar, brown preferred, which has been melted without water in a saucepan. Cook until it ripes well. Remove from fire and beat well for five minutes. Add a teaspoon of vanilla, spread while warm and cut in squares.—Mrs. Geo. F. Herrick, Riverside.

Caramels

Four cups granulated sugar, one cup glucose or white corn syrup, one large can evaporated milk, one-half cup butter. Stir all together and cook until it will harden when tried in cold water, stirring constantly. When done add teaspoon of vanilla, nuts if desired, or for chocolate add small tablespoon of cocoa or grated chocolate.—R. F. C., Hemet.

One Pound of Fondant

For chocolate, walnut or other cream candy into a small aluminum or granite kettle put two cups of granulated sugar, one cup of cold water and little cream of tartar. Measure both sugar and water in same cup. I fill a teaspoon level full of cream of tartar and cut across each way, then use one-fourth of the spoonful for above recipe.

Before placing on hot stove stir till all the sugar is moistened, do not move the pan nor stir after it starts heating. Boil rapidly and after six or eight minutes put a little into cup of cold water. If it hardens so you can gather into soft ball in the spoon it has cooked enough. After a few trials you will be able to tell when it is just right. I like to take it off a little too soft rather than too hard. When done cooking set out to cool on inverted steamer or wire frame so bottom will cool too. It is ready to stir when you can hold your hand on the bottom of kettle for awhile. Put cover over kettle so top will not cool rapidly enough to crust. If you stir it too warm it will cream quickly but it will be grainy. If too cool it will remain syrupy.

A silver or wooden spoon was recommended to me, but I cannot see any difference, so be sure to stir rapidly in the same direction without stopping. As soon as you can lift it in your hand place on waxed paper. Take it up and work between your hands. It will soon become very creamy. Divide into as many parts as you want different flavors. Dent each piece and drop extract into depression. You can color with cochineal for pink or red, with vegetable paste for violet or orange. After melting chocolate in small bowl over teakettle add small piece paraffin. A friend told me a short time ago that she used a broken knitting needle to hold fondant or cream ball and had a piece of window screen under the waxed paper. I tried it and certainly it works beautifully. Stick end of needle into ball, dip into melted chocolate and paraffin, turn till well covered and drained, press other end of needle through waxed paper and through screen and your cream is in perfect shape.

Grind any nuts fine and work into fondant. Cut into squares and wrap in waxed paper Dip or roll fondant balls in fine cocoanut. Grind fresh cocoanut and work in same as nut meats. Our greatest advantage is in knowing that we have a perfectly pure candy and that the cost is many times less than we must pay for the same grade of candy. In most homes the children enjoy the making as much as the eating.—Allen Corwin, Mesa, Washington.

After Dinner Mints

Four cups granulated sugar, one-half pint glucose (best grade), one-half pint water. Boil on quick fire to "crack" or between 290 and 300 degrees on thermometer. Boil without stirring, add two ounces butter, remove from fire when butter is melted; pour out. When cool pull until white, flavor with peppermint while in last stages of pulling. Pull out like sticks, cut into one-half-inch pieces with scissors, roll in powdered sugar and leave 24 hours to ripen.—Mrs. M. Garrett, Merced.

Maple Panoche

Grate one pound of maple sugar, add one cup milk. Stir over the fire until the sugar is dissolved and then boil until the syrup forms a soft ball when dropped in cold water. Take from fire, stir for a moment until it begins to thicken, then add hastily half pint pecan meats and turn the mixture into a square greased tin. When partly cold mark into small squares with greased knife.—Jessie G. Storer, Beaumont.

PRIZE WINNERS

First prize, Miss Emma Gatzke,, for "Honey Fudge;" second prize, Allen Corwin, "One Pound of Fondant."

It is an actual fact that music will lessen physical fatigue by relieving the nervous tension. Its influence on the mind is likewise phenomenal, for it turns the current of thought into a new and more pleasant channel.

43.7%

or almost one-half

of all the interest paid by Los Angeles Banks for the year 1914 was paid by the Security Trust & Savings Bank.

The entire amount paid by all the banks in 1914 was $2,907,780.

The SECURITY paid to depositors in 1914, $1,270,877.61. getting better.

On January 4th we opened 191 new accounts. This is an unprecedented number and demonstrates two things:

1. That times are surely gettink better.

2. That the SECURITY is the Savings Bank selected by the majority of depositors.

The SECURITY is also at your service.

Citrus Fruit Market

LOS ANGELES, Jan. 20, 1915.

Very quiet conditions prevail, although it is possible the orange market is rather more hopeful than last week. There is an immense quantity of fine fruit to go forward, but it is of such high quality that if there is no panic or pressure to ship too heavily at one time fair returns should be secured. Fruit which was frozen on board cars in transit has been almost entirely cleaned up.

Lemons are rather better in general tone, but no great advance is anticipated until the heavy demand which will be caused by the warm weather of spring.

Shipments

Shipments of oranges to date from Southern California since November 1, 1,222 cars, lemons 639, total 6761. To same date last season, oranges 2980, lemons 314, total 3294. From Central California, oranges 4988, lemons 105, total 5093. To same date last season, oranges, 4057, lemons 25, total 4082. From Northern California counties, oranges 495, last season 395.

NEW YORK, Jan. 18.—Sixteen cars navels, two cars lemons sold. Market higher on navels and lemons, unchanged. Raining.

BULLETIN OF CALIFORNIA CURED FRUIT EXCHANGE

SAN FRANCISCO, Jan. 5, 1915.

We wish everybody a happy New Year and hope that the coming season will be a prosperous one for us all. The year 1914—just past—especially as far as dried fruits are concerned, will go down in history as one containing a great number of serious problems. Many things happened which had never happened before and for which we had no precedent. In the first place the European war, coming at a time when dried fruit packers were receiving fruit and getting ready to commence forwarding the apricot crop to Germany and other foreign countries, left everybody in a very uncertain state of mind as to what the outcome might be; with not only the possibilities of shipment and the financial and other abilities of export buyers practically wiped out, and the uncertainty as to what amount of fruit would be used by the foreign trade, the values of dried apricots declined very materially, and it looked for a while as if all the dried apricots which in former years had been exported would have to be consumed in this country (the major portion of the dried apricot crop produced in California has in past seasons been shipped to foreign countries), but after awhile things commenced to shape themselves around so that England and some of the other European countries commenced to buy dried fruit, but at a much lower range of prices than if conditions had remained as they were before the declaration of war. It looks now as if the dried fruit crop of 1914 will be entirely cleaned up before the 1915 crop comes in. Today apricots are held firmly at advancing prices and there is a slightly better demand.

Prunes in the earlier part of the season commanded a high price, but after the war commenced they dropped; they are now being held at fairly good prices, and on this commodity we are looking for good prices to be obtained after the buying season starts in again.

Exports have been heavier than at first anticipated, and domestic markets should take the balance of the crop now on hand. Many of the European markets which in former years bought fruit through Germany have been buying direct, and the matter of credits is shaping itself up in a very much better way than was expected some few months ago.

There is very little change in the raisin situation; the little new business which is being done is done at prices slightly under the prices of the Associated Raisin Company.

Dried peaches have been the lowest of all the commodities this year and have been somewhat of a drug on the market. The cotton situation in the South has affected this line very materially and while there is practically nothing doing in peach sales now there is an indication that prices will be better before long as this line is being held a good deal more firmly than it has been in the past.

The dried fruit tonnage in this state was very much heavier than last year, and considering the conditions which have existed, together with the increased tonnage we have, while the prices have not been as good as they might have been they might have been a great deal worse.

We quote you from the "California Fruit News," as to the tonnage of the crop of 1914, as compared to that of 1913; which is as follows:

	1913	1914
Apples	1,900 tons	4,000 tons
Apricots	10,500 tons	19,500 tons
Figs	5,000 tons	6,200 tons
Peaches	23,000 tons	32,000 tons
Prunes	48,000 tons	51,000 tons
Raisins	65,000 tons	90,000 tons
Various Others	2,000 tons	2,500 tons

We think these figures, generally, are correct, with possibly the exception of prunes, which may be a little high.

Dried fruit shipments by water have been very much ahead of last year owing to the opening of the Panama Canal. The larger percentage of dried fruit has been shipped by water instead of by rail. Reports on the movements of the German navy have been the cause of a great deal of anxiety to the water carriers, and things are not in quite as good shape in the way of shipping as they were a little while ago, but we feel that the note which the United States government has sent the British government will probably have an effect before long and that the result of it will be most advantageous to the Americans in doing business with neutral countries.

This being the time of the year when buyers are taking stock and generally winding up the year's business, orders will be slow until things get back into normal condition. The conditions in Europe will probably have a good deal of effect on the coming year's business, but we are looking generally for a better feeling all over the country and also for a quick revival of business. A nation-wide campaign to assist in the revival of business was launched in Omaha a few days ago; the movement proposes to quicken commerce and manufacturing by hastening purchases which must be made sooner or later. The general feeling of depression in this country has been caused not so much by actual need or want as by the thought that everything is in bad shape. There is plenty of money in the country, and if everyone would make up their minds that things are going to be good we would soon have plenty of business.

It looks as if in time our government will pass a law dealing with loans to farmers. Today's paper states that President Wilson has received pressing requests from different parts of the country that rural credit legislation be taken up during the present session of congress. He is considering the advisability of changing his plan and putting the subject over until next December; Chairman Glass of the house banking committee having told the president that it would not be advisable to take up the subject until time had been allowed for the working out of the farm loss features of the federal bank law. If this becomes a fact, after a while it will tend very much to relieve the necessities of the farmers all over the country. How much lower rate of interest, if any, they will be able to get money at we do not know, but unquestionably the government will be very particular in making loans, just the same as banks are now, and will not loan money indiscriminately, but only on good security.—CALIFORNIA CURED FRUIT EXCHANGE.

BERRY SPECIALIST

Mr. Alfred Mitting, who was some years ago located at Santa Cruz and later returned to his old home in Michigan for the purpose of propagating berry plants, has returned to California and will make Santa Cruz his permanent home. He has brought with him his new Macatawa everbearing blackberry, besides many other valuable specialties. He is planning to be able to deliver from 1,000,000 to 1,500,000 plants to supply his increasing trade. Mr. Mitting is now mailing his 1915 catalog of small fruits. It contains a fund of information that makes it almost necessary to the progressive berry producer.

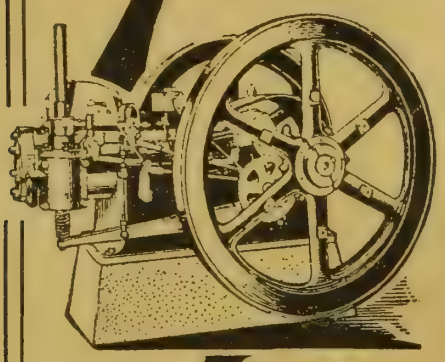
STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅔c per gallon, cost one third of a cent per HP. per hour to operate.



All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

Before you buy an engine send for our catalogue—free to all who write for a copy.

buying and maintaining

The highest grade materials available for each particular purpose are used in building The Yuba Ball Tread Tractor.

It costs us more to use manganese steel than cast iron; high duty roller bearings than the babbitt or bronze type; to have our motors built at the same plant that builds the highest standard motors for automobiles and motor trucks.

When we add a reasonable profit it naturally makes the first cost of The Yuba Ball Tread Tractor slightly higher than most others.

The economy of The Yuba Ball Tread Tractor shows at the end of a year's service, when the cost of maintenance is added to the first cost and compared. It will show more forcefully at the end of each year following.

THE YUBA BALL TREAD TRACTOR

High grade materials and careful workmanship reduce the number and cost of repairs.

This booklet tells what materials are used, where and why.

The coupon, filled out and mailed, brings it.

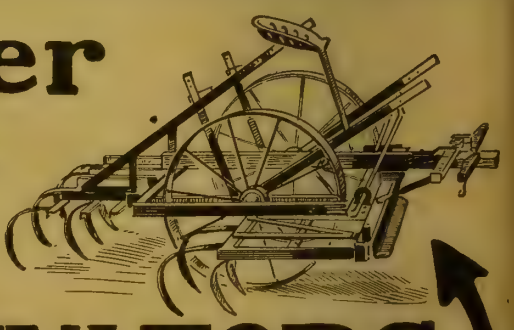
Forkner Light Draft CULTIVATORS



— cut cultivating costs in two.

For Orchard, field and alfalfa work there is no other cultivator that will give such splendid satisfaction as the Forkner. It has many special features, chief of which is the light draft; it works close up to trees, cultivates perfectly, is easy to operate. Construction is strong but simple. Driver may walk or ride at will.

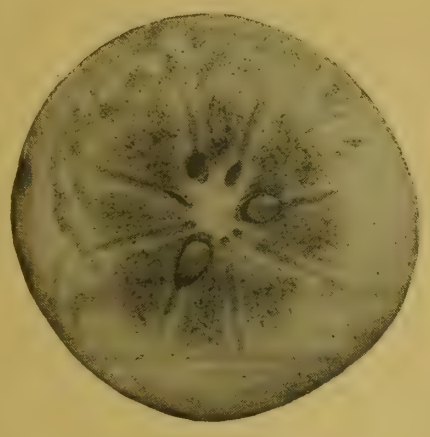
What About the Persimmon?

Interesting Items Gathered for Cultivator Readers by I. J. Condit. Varieties Described and Methods of Handling Fruit in Japan Given

DURING the past two months I have been greatly impressed with the woeful lack of knowledge on the part of the general public regarding the proper use of one of our most delicious fruits, the Japanese persimmon. I have succeeded in educating several relatives and friends up to the point of eating only thoroughly ripe persimmons and now they are enthusiastic in their praise. Instead of regarding it as a bitter, puckery fruit fit only to use in perpetrating jokes upon the unwary friend or tourist, they consider it a fine delicacy and are beginning to distinguish between the poor, stringy varieties and the rich, juicy ones. There is not the least doubt in my mind that there are thousands of Californians who simply need a good introduction to the quality of a ripe persimmon to make them also not only its admirers but its frequent purchasers. The old idea that persimmons are not edible until after a heavy frost is no longer a correct one since there are many trees of the native American species in the southern forests, which ripen their fruits before there is any sign of frost, while in California the Japanese varieties are largely picked and marketed before frost occurrence. Astringent varieties should be perfectly soft and mushy before any attempt is made to eat them. Since it is impracticable for the grower to ship the fruit when soft, it must be picked and shipped when still firm and allowed to ripen on the fruit stands or in the home of the consumer.

The kaki or Japanese persimmon was introduced into California about 1870 and is to be found to a greater or less extent in nearly every county in the state. The tree is easily grown, is free from serious diseases and insect pests, and in most cases exceedingly prolific. The fruit is very attractive in appearance, ships well to both local and distant markets, and is almost universally liked if eaten in the proper condition. Why then has the persimmon remained one of our minor fruits rather than taken its place among the leading fruits as it has in Japan? Various reasons may be assigned for its lack of popularity, chief among which are the following: The general lack of knowledge among consumers as to the value of the fruit and its proper condition for eating; the failure of the growers and marketing agencies to advertise the fruit and educate the public as to its use; the grower's lack of attention to the subject of varieties, pollination, natural and artificial ripening; the failure of growers to develop the industry in by-products, such as dried persimmons. I hope to be able in the following paragraphs to discuss some of these points which will be of value to persimmon growers and to others who are interested in the development of the industry.

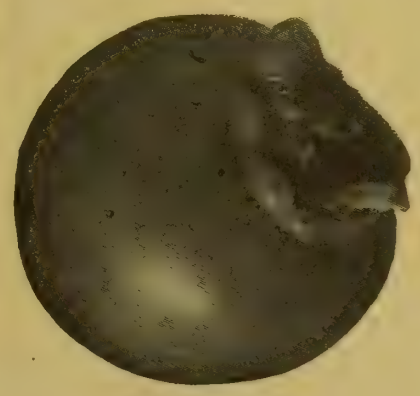
The varieties of Diospyros kaki, to which the Japanese and Chinese persimmons belong, have been variously classified in different countries. In Japan they are grouped into sweet and astringent varieties; in Florida into light-fleshed, mixed-flesh and dark-fleshed varieties. Both of these classifications are unsatisfactory since the color of the flesh is known to be affected by pollination. Some varieties are dark-fleshed and sweet when they contain seeds, but light-fleshed and astringent if seedless. The accompanying photographs show the effect of seeds upon the color of the flesh.



Saburoza Persimmon, Recent Introduction into California.
Maru Type Persimmon, Center Darkened by Presence of Seeds, Outer Section Light-fleshed.

A very satisfactory classification has recently been made by Professor Hume of Florida who has lately returned from a study of persimmons in Japan. Those varieties which undergo no change in color when pollinated are referred to as pollination constants, while those which are light-colored when seedless and dark-colored when seedy are called pollination variants. Examples of the former are Costata, Hachiya, Ormond, Tamopan, and Tsuru. Examples of the latter are Hyakume, Okame, Yeddo Ichi, Yemon and Zengi.

Certain varieties of Diospyros kaki bear both staminate and pistillate flowers. Some bear staminate flowers regularly every time the tree blooms, while others produce them one season and not another, in fact are very irregular in this respect. The grower can easily distinguish one kind of flower from the other. The pistillate flowers which produce the fruit are large, from one-half to three-fourths of an inch long, and bear very large calyx lobes at the base; the staminate flowers are smaller, do not have such large calyx lobes, and produce pollen from the eight stamens. Our best Japanese persimmons such as Hachiya and Tanenashi produce only pistillate flowers. Two sorts have been found which bear staminate flowers regularly, the New Sien and Siang, both of which were secured in China. In Florida where some varieties fail to bear regular crops it has been found profitable to plant a few pollenizers, or staminate varieties, among the other trees, or to insert a few buds of such a variety in a fruiting tree. This insures sufficient pollen to cause the fruit to set but reduces the number of seeds to a minimum. Since dark flesh is always accompanied by the presence of seeds, and since this dark flesh is always non-astringent, it is important if a dark-fleshed variety is being grown to insure good pollination of the fruiting trees. A few years ago Mr. Avery of Newcastle, who fancies a dark-fleshed persimmon, obtained from Florida 100 trees of the Yeddo Ichi, a normally dark-fleshed variety. These have been bearing now several seasons but the fruit is not uniformly dark-fleshed, being entirely light when seedless, dark near the seeds when one or two seeds are found, and entirely dark-fleshed when several seeds are present. Five or six seeds are not very objectionable and my opinion is that the quality of many dark-fleshed persimmons is much superior to that of some seedless light-fleshed varieties.



The Yeddo Ichi, One-half Dark Fleshed Account of the Presence of Seeds.

It is a well known fact that some varieties of persimmons in California bear mostly in alternate years. This has been true in Japan for one Japanese writer says that trees which are unpruned and the fruit of which is unthinned have the habit of bearing in alternate years. It is probable that if California growers would practice thinning of the fruit before it is half grown, more regular crops would be assured. Thinning increases the size of the fruits left on the tree, and increased size means better prices.

The astringency of the unripe persimmons is due to the presence of soluble tannin in cells of the fruit. The effect of this tannin is not noticeable the instant a piece of the fruit touches the tongue as it requires a short time for the tannin to dissolve in the saliva; its puckery effect is then pronounced, more so in some varieties than in others, and a second taste of such a persimmon is not usually attempted. As the fruit matures, however, the tannin becomes more and more insoluble until in a perfectly ripe specimen it is no longer perceptible.

Good varieties which are dark-fleshed and non-astringent when mature if a sufficient number of seeds are present are, Yeddo Ichi, Taber's 129, Hyakume, Zengi and Daidai. The Tamopan is a Chinese variety introduced by the department of agriculture and is described as being non-astringent so that it can be eaten even when firm. It has fruited in at least two localities in California, but in both cases the fruit has remained astringent until soft. I understand it has proved a good variety in Florida.

Artificial ripening of persimmons has been practiced in Japan for many years. The first reference in American literature to the Japanese method has been supposed to be that of Professor Tamari in the Transactions of the Michigan Horticultural

Citrus and Tropical Fruits

JELLY FROM CULL CITRUS FRUITS

Written for California Cultivator
By W. V. Cruess and J. E. Quiroga

THE production of jelly from any fruit grown in such quantities as the citrus fruits does not offer anything approaching an adequate outlet for the cull fruit. However there is little doubt that there would be a fair demand for orange or lemon jelly of good and uniform quality. The enology laboratory of the university has produced such a jelly from many different lots of oranges and in several cases from lemons. The results of the investigations are given in what follows.

For any fruit to be suitable for jelly making, it must first contain pectin, a substance that gives jelly consistency to any true jelly. Oranges contain an abundance of pectin, although in overripe oranges the amount is a great deal less than in ripe or underripe fruit. Lemons, so far as tested, jelly even more readily than oranges, indicating a higher pectin content. The second requisite is acid. Oranges usually contain enough acid, but with overripe fruit the acid must be augmented by addition of lemon juice. The third quality is flavor. Neither oranges nor lemons are lacking in this quality.

Preparation of Fruit for Extraction of Pectin

Pectin is more soluble in hot than in cold water and dissolves more rapidly the smaller the pieces of fruit. The first step then is making the fruit into small pieces so that the pectin can be gotten into solution. The skin, and especially the white inner skin, contains most of the pectin. Therefore the fruit and particularly the skin must be sliced very thin or crushed. On a small scale a food chopper or sausage grinder set for coarse cutting is satisfactory; for large scale operations an apple grater would no doubt answer.

Extraction of Pectin

The crushed or sliced oranges must be boiled to soften the fruit and extract the pectin. If cooked over a direct fire a small amount of water must be added to prevent burning of fruit on the bottom of the pot. The water and juice must be brought to a boil and boiled slowly till fruit is soft, usually 45 to 60 minutes for oranges; lemons are tougher and take longer than oranges. Too long boiling or too rapid boiling destroys the pectin and consequently injures the setting power of the jelly.

Press the juice from the boiled material while still hot. Pressing should be done slowly through heavy cloths or canvas to keep the particles of pulp from getting into the juice. With fruit high in pectin water may be added in small amount to the pressed pulp; reboiled and repressed and the first and second pressings mixed. As a regular procedure this second pressing is not recommended.

Lemons are crushed and pressed cold to remove the juice. The peels are then covered with water and treated as above. The juice can be used for bottling or blending with orange jelly stock to give it acid. The jelly stock from the lemon skins is treated in the same manner as orange jelly stock.

Clearing Jelly Stock

The ordinary method of clearing jelly stock is by hot filtration through heavy flannel bags. This is a slow and laborious process, though effective. Laboratory experiments have shown that the juice from the pressed oranges and lemons clears of its own accord by letting it stand 24 to 36 hours to settle. The clearer upper liquid can then be drawn off and used as directed below. It is well to emphasize this method of clearing; it has been found to apply to berry juices as well and very probably will apply equally well to any fruit jelly stock. The important precaution to observe is; do not let it stand too long or the pectin will gradually precipitate and be lost in the sediment. The sediment can be strained through flannel or bag filters in the ordinary way while the clear supernatant liquid is used without filtration.

Adjusting Acidity

The acidity of the expressed and settled liquid should be above .7 per cent and below two per cent. The United States department of agriculture has given direction for making the acid test. (See Cultivator of October 29, 1914, page 411.) Many oranges will have enough acid; but for safety in cases where it is not convenient or possible to make an acid test the juice from two lemons

The Use Of Hercules Dynamite On Farm, Orchard and Ranch

THE series of bulletins on dynamite which will appear in this publication are published with one aim in view—to give you intelligent and accurate information with regard to the large place dynamite can be made to fill in your work.

Every statement made with regard to the use of Hercules Dynamite will be absolutely accurate and based on results obtained in actual field work. The various diagrams and plans will show the best methods of using dynamite. The illustrations showing the results obtained from the employment of Hercules Dynamite will be copied from actual photographs.

We are always glad to give any information or assistance to those interested in the use of dynamite. Thousands of men whose interests are the same as yours are saving time, labor, and money by its use. What is equally important, they are getting better results. We urge that in justice to yourself and your work, you send for a book which we have published, entitled, "Progressive Cultivation." Use the coupon in the corner of this announcement.

HERCULES POWDER CO

Tree Planting

The two illustrations above show fully the value of using dynamite in planting trees. These drawings are exact copies of photographs of two trees planted at the same time and in the same orchard. The one on the left was planted in a spaded hole, the other in a dynamited hole. The growth and development of the latter is almost twice that of the former. This difference always shows when Hercules Dynamite is used.

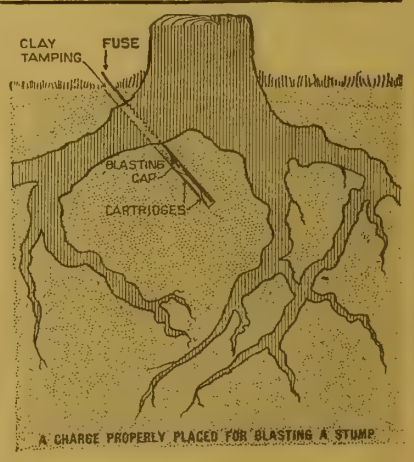
The ground is thoroughly broken up. The roots have a chance to spread in a natural manner. Also the work of planting is done more quickly and at less expense. In "Progressive Cultivation" are given interesting details with regard to the use of Hercules Dynamite for tree planting. Are you familiar with the method and its results?

Stump Blasting

Every man who has had experience in pulling stumps *without* the aid of dynamite knows only too well the amount of labor and time involved.

When you have land to clear, use Hercules Dynamite. You not only save labor and time—and, as a result, money—but you also thoroughly break up the subsoil and very effectively prepare the land for cultivation.

The diagram given shows the best way of removing one kind of stump, that with matted, spreading roots. When dynamiting a stump with a tap root the charge should be placed differently to get the best results. "Progressive Cultivation" tells just how stumps of various kinds can be most readily removed.

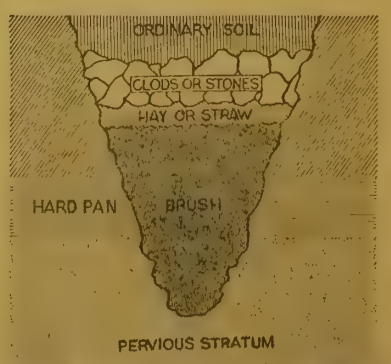


A CHARGE PROPERLY PLACED FOR BLASTING A STUMP

Drainage Work

The draining of swamps and ponds can be done better with Hercules Dynamite than by any other means. There are several ways in which dynamite may be used. We have room to illustrate only one of them — the crater method. By this method the hard soil forming the bed of the swamp is broken up and the water drains off through the loose stratum below.

In "Progressive Cultivation" full details with regard to drainage work with dynamite are given.



BLASTED CRATER FOR DRAINING SWAMPS AND PONDS

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas

California

U. S. A.

Teague trees are started right, grown right, and shipped right.

to one dozen oranges should be added. Jelly stock made by boiling lemon peels with just enough water to cover them contains enough acid; lemon peels boiled in the lemon juice give a liquid too high in acid. Thus the juice from lemons may be used to acidify the orange jelly stock, while the peels may be extracted with water for lemon jelly.

Experiments showed that an acidity of less than four-tenths per cent in the final jelly gave poor or negative results and that acidities above one and five-tenths per cent in the final jelly gave rapid setting, but later softening and "stringiness" in the jelly. It must be remembered that after the sugar is added the jelly stock increases approximately to double its first volume. Hence the acidity of the original stock decreases by about one-half on adding sufficient sugar for jelly making.

Addition of Sugar

A fruit extract prepared as above will not set to a jelly until the concentration of the material dissolved in it reaches a certain point. The most practical way of increasing the dissolved material is to add sugar. The amount of sugar used is governed by the following factors:

First: Enough must be used to cause jellying of the pectin. Above 55 per cent Balling or 30 Baume.

Second: Enough must be used to prevent fermentation. Above 55 per cent Balling or 30 Baume.

Third: Too much can not be used or crystals will form in the jelly. Not above 67 Balling or 36.6 Baume. The addition of one and one-half volumes of sugar to one volume of jelly stock gives the desired concentration. Sixty per cent Balling or 33 Baume gives the best results. The test is made by dissolving the sugar by warming the juice till sugar disappears, pouring solution into a cylinder of metal or glass approximately 15 inches by 1½ inches; inserting Balling or Baume sugar tester and reading amount of sugar indicated at surface of the syrup. A range of 58 to 62 Balling and 32 to 34 Baume is permissible. The sugar testers are made to be registered at 60 degrees Fahrenheit. Therefore the temperature of the material must be taken when sugar test is made. For each degree Fahrenheit above 60 degrees add .055 per cent to reading of sugar tester, or approximately ½ per cent for each 10 degrees Fahrenheit above 60 degrees Fahrenheit. Example: .Temperature 120 degrees Fahrenheit; sugar 55 per cent. Correction, 6x½ equals 3 per cent. Corrected reading equals 55 plus 3 equals 58. For Baume sugar tester add ¼ per cent for each 10 degrees Fahrenheit above 60 degrees Fahrenheit.

Boiling

Heat gradually to boiling. Boil slowly three to four minutes, skimming constantly to remove albuminbids coagulated by the heating.

To test success of operation allow the liquid to drip from a cold cook spoon. If drops congeal the material will probably jelly.

In Glass

Pour into glasses through a thin cloth. While still hot melt enough high grade paraffin to cover each glass with a layer of melted paraffin one-eighth inch thick. Let cool and jelly should set sufficiently to hold its shape when emptied out of the glass one week after making. The paraffin prevents mold growths and

Deciduous Fruits

FIG PLANTING IN CENTRAL CALIFORNIA

Written for California Cultivator
By Sacramento Valley Contributor

"FOR today, tomorrow and your children's children, plant figs." Is not this a good proposition for the prospective planter of fruit trees in the Sacramento and San Joaquin valleys?

There are many who are in close touch with the fruit situation who agree that it is.

As has been said many times before, and as can well be said frequently for the benefit of those who intend going into the fruit business in California, particularly those from the East who are setting out young orchards, the wisest one in the business, the one who is in the best position to know, may be wrong, for only the future itself can tell what the future will bring forth.

But there are a number of favorable things to be said for fig growing in this great central valley of California. The area of land in the United States well adapted to fig growing is not large. There is this California territory, part of Arizona and a strip along the gulf of Mexico. But frost is a factor that interferes with the growing of the crop in the last named territory.

And in the rest of the world, while there is a considerable acreage adapted to the growing of the crop, the extension of industries in the old world is not as rapid as it is in the new, active parts of America, and the competition from that source is not to be looked upon seriously.

Then the demand for good figs and fig products in the world is growing very rapidly. The fig is a food and in common with all of our California dried fruits filled with sugar from our rich soil in combination with the air and an abundance of sunshine. The demand for it is sure to grow.

And demand for a product should fix a fair price for it to the grower. If it doesn't it is up to the grower or growers to see that it does.

Then the next thing, after demand, to make a favorable business opportunity of the fig is ability to grow a product of good quality and of ample per acre tonnage.

All of which is answered by the bearing trees from Redding to Bakersfield.

No better figs are grown on earth than in this territory, and nowhere is the yield per acre any greater.

WHAT ABOUT THE PERSIMMON?

(Continued from Page 99)

Society for 1886. In the California Horticulturist for March 3, 1877, however, it is stated that the most luscious Japanese persimmons are ripened by air tight enclosure in casks containing sake (a kind of beer made of rice) which in two or three weeks perfect a remarkable flavor." A description of the Japanese method of drying persimmons is also given. Dr. Knapp, who introduced some Japanese persimmons into the United States in 1899, also made reference to this method of processing but, curiously enough, little attention seems to have been paid to these early accounts by American growers. Mr. George Roeding of Fresno was probably the first one to use this method of ripening persimmons in the United States. In 1905 he reported that he was astonished to see how completely the bitterness had left the persimmons although they were just as hard as when put in the tub 11 days before.

During the seasons from 1907 to 1910 the whole subject of the growth and ripening of persimmons was being investigated by members of the bureau of chemistry at Washington. It was first found that butter tubs whose walls were saturated with dilute alcohol were found to serve as well as sake tubs soaked with sake. Some trouble was experienced however in softening of the fruit and it was evident that such softening must be controlled if processing was to be successful on a commercial scale. Experiments were therefore started with carbon dioxid with the belief that this gas could have little effect on the vital processes of the fruit as it was continually being formed by the fruit itself. All of the experiments were carried out with a practically pure atmosphere of carbon dioxid at normal atmospheric pressure.

The results of these experiments showed that if persimmons are kept in carbon dioxid during processing they tend to remain firm, the lack of oxygen apparently retarding the life processes which result in softening. Fruits processed in carbon dioxid gas for from three to five days became non-astringent while remaining firm. The presence of alcohol at times hastened the ripening process but the fruits lost somewhat in the quality of crispness and in two instances showed superficial injury. The rate of softening of persimmons was on the whole slightly but distinctly accelerated by processing, although in the case of Okame this softening was controlled by cold storage. Processing by keeping the fruit under water or other liquids was unsuccessful as the processing did not occur rapidly and the fruit was often badly injured. Persimmons processed readily in carbon dioxid after a cold storage interval of 27 days but softened rapidly after processing.

In the year 1911 Professor F. E. Lloyd, then of the Alabama Polytechnic Institute, showed that the operation of processing persimmons was practicable and could be carried out with churn barrels at a small cost. It was found that the successful use of the carbon dioxid depends first of all upon the proper handling of the fruit. The slightest bruises were quickly made conspicuous when the fruit was treated and became centers of softening. If processed in bulk the fruit can best be packed in layers of excelsior, which was found to absorb superfluous moisture sufficiently to prevent cracking of the fruit. During the same year H. C. Gore of the bureau of chemistry perfected a metal apparatus by which the processing could be performed on a commercial scale. It consisted of

a metal container into which carbon dioxid was passed from a steel cylinder such as those used at soda fountains. All of the varieties tried became non-astringent in from one and one-half to seven days, depending upon the variety. The fruits were processed on a large scale in Florida and were subjected to shipping tests with the exception of two varieties, Hyakume and Yemon. With one exception (yellow-fleshed Zengi) processing greatly injured the naturally excellent shipping qualities of the fruit. Tanenashi was less seriously affected than many of the others. Zengi was practically unaffected in shipping quality by the treatment. Processing was found to be practicable therefore only for the local market. A detailed account of these experiments may be found in Bulletins 141 and 155, bureau of chemistry, United States department of agriculture, Washington, D. C.

In Japan persimmons are largely dried, the product forming a staple article of food which is used much as we use dried figs. For this purpose sound persimmons of certain varieties (the Hachiya and Tanenashi are largely used) are picked with a T-shaped piece of twig attached to each fruit and peeled by hand with a small special knife. The fruits are then suspended on strong strings two of which have been twisted together; beginning at the bottom the workman slips each fruit between the strings continuing until the whole string is full of fruit. The string is then hung in the sun and air, which cause the persimmons to dry in about three weeks. The peelings are dried separately in airy baskets and later packed in with the dried fruit.

New varieties of persimmons, both American and Japanese, are appearing from time to time, the former being improved types of those found growing wild in the central and southern states, while the latter are imported directly from Japan and China by the department of agriculture, by nurserymen and by individual growers. A variety recently introduced from Japan and known as Saburoza is shown in the accompanying illustration. The exact date of its introduction into the United States is not known. My first acquaintance with the variety was made when some specimens were received from W. L. Whepley of Lemon Cove in October, 1914. He bought the trees from the Fancher Creek Nurseries a few years ago and when the first fruit was produced it proved to be entirely distinct from any other variety fruiting in California, having a natural trademark in the form of four prominent protuberances or "seats" as the Japanese call them, just beneath the calyx lobes. In November I found the same variety in the orchard of Ira Avery at Newcastle. It was identified as the Saburoza by S. Fujii, a senior student in the college of agriculture, who is writing his thesis on the subject of the persimmon. It is described in Japanese publications as an astringent variety widely grown in the provinces of Fukui, Ishikawa and in the northern part of Shiga in Japan. It is said to have originated in either Fukui or Ishikawa; judging from various circumstances, however, Fukui seems to be the true home. It is widely shipped as Taru-kaki (sake-barrel persimmons) but the flesh is said to be coarse and deficient in sweetness and juiciness, and therefore the quality does not rank high. The tree is a very thrifty grower in Japan and very prolific.

The California specimens are of an unusually fine deep-red color and are certainly not deficient in juiciness and sweetness as the Japanese description states. The description of specimens sent by Mr. Whepley is as follows:

Weight, 140 grams; diameter, 2⅝ inches, distance from base to apex, 2⅛ inches; shape, roundish, apex and base somewhat flattened; cavity, sunken, bordered by four regular protuberances each less than ¼ inch high, and about ¾ inch long; skin, thin, tender; surface, smooth, free from blemish, overspread with a grayish bloom, especially near the base; color, very attractive, deep tomato-red, uniform; flesh, soft, melting, slightly stringy, dark-colored when seedy, sweet, rich and of good quality; seeds, brown, about ¾ inch long.

VINEYARD PRACTICE

About 200 raisin growers met at Fowler recently to hear a talk by Frank Henry, vineyardist of Fresno County on pruning and cultivating vines to get two or three times the crop ordinarily obtained. Henry expects to go to Australia next month to make a further study of fruit growing.

Henry said that the only successful system for the grower should be to aim towards getting quality first by all means and the quantity would usually follow whenever first-class quality was obtained. He called attention to the fact that the market is always ready for goods of high quality, whereas often there is little or no market for poor goods even if grown in large quantity.

Emphasizes Two Points

He laid stress on two points in cultivation, that the soil should be taken away from around the vine stump to prevent starting of roots near the surface only to dry out later in the

(Continued on Page 119)

This picture shows a few of our perfectly formed, thrifty, vigorous apple trees in nursery row.

Apple Trees

OUR STOCK of apples this season is more complete in varieties than it has ever been and and we do not hesitate to say, as far as the quality of the trees is concerned, that there is nothing grown that is superior to them. Our trees are far better than northern or eastern grown trees and are freshly dug, carefully handled, and placed in the hands of the planter in perfect condition, and at the time he wants them.

We can supply such leading varieties as Spitzenberg, Baldwin, Stayman Winesap, Rome Beauty, White Winter Pearmain, Yellow Belleflower, King David, etc.

We are offering special inducement on our apple trees and it will certainly be worth your while to figure with us before you place your orders. Write us fully and let us know what your plans are.

We Grow Everything that Grows

There is practically nothing in the line of citrus and deciduous fruit and ornamental trees, vines, plants, etc., that we cannot supply you. This is the only nursery on the Pacific Coast that can supply practically everything you may wish and fill your orders complete. Send us your list for prices and suggestions.

Illustrated Price Catalog Free

Our 1915 illustrated price catalog is more complete than any that we have heretofore issued. It lists and prices all stock grown by us—something over 2,000 varieties. A copy will be sent free to any address upon request.

THE CALIFORNIA GARDEN

Written for California Cultivator
By Ernest Braunton

IF I lived in the country there should be a large rock garden somewhere on the premises, even if nothing better could be done than pile up and scatter small rocks over a small area, as we do in the cities. But if I had a canyon, ravine, gully, wash, call it what you will, I would have a real rock garden. And after getting it once established it would care for itself, for I would have a natural or wild rock garden that would be just a riot of rocks and dry-garden plants that would not be figuratively calling for water and care during our hot summer. Rocks should be large, small, on hills, banks, and flat ground, in holes, corners, nooks—everywhere—no orderliness or design but just careless disposition—no strained effects but as near as possible to what I think nature would do with them. I would get all the rocks I could use and still have soil enough to give the scene a good touch of plant life.

For plants I would use any that would grow. Vile weeds would be rooted out but wild tobacco, bush lotus, humming-bird flower, the tiny flat milkweed or Euphorbia, or any natives standing summer drouth well would be encouraged. In addition to these I would introduce everything of like nature I could find. If the garden was of small size or summer watering possible I would add to these, stonecrops, ice plants and sedums, hen and chickens, live-forevers, etc. Visits to the neighboring hills, mountains and canyons would disclose a wealth of plants for rocky situations in both shade and sun, yet where little soil or water was available. Ferneries are not considered here as coming under rock gardens, but if any class of plants is to be specified I would say it should be that hardy, drouth-resistant class known as Alpines. In England rock gardening is a fad quite common, but do not let us despair by reason of a dry climate. Let us have California rock gardens.

Climatic Conditions

Mrs. Ely, in her book entitled "A Woman's Hardy Garden," says: "Except by the seacoast our dry summers, with burning sun and in many places frequent absence of dew, are terribly hard on a garden."

And this on the Atlantic coast! What would she do if contending with a summer in California? All this is prefatory to stating our text, which is given us by good Eastern authorities who write that summers are too dry and hot for outdoor roses except those grown in partial shade. This is much more true of California and yet even here we may have summer roses and excellent ones too if we will but plant them in the shade of large trees or in hothouses. The possibilities of the hothouse in summer are so great that I believe the time will come when its value for private gardens will far outshine all other values combined. Down in Mexico and Central and South America all large gardens have their hothouses for the growing of summer flowering plants; not in pots, but in Mother Earth. In this way may we get summer roses, dahlias, chrysanthemums, carnations, and a host of flowers we now consider out of season during summer. This method is not necessarily expensive as regards care nor is it fighting natural forces. It is merely assisting nature and requires no more care than do the same plants out in the open garden during what we term the cool weeks of autumn or of spring.

Fertilize Little but Often

Two cases of damage to flowering plants by excessive fertilization have been brought to my notice of late. In one commercial fertilizer was used and in the other, by far the worst, chicken manure was put close about the roots in large quantities. Chicken manure fresh from the coops, where winter rains have not lessened its strength, is a powerful stimulant and should be used with caution. There is little use going into detail advising the use of absorbents, etc. The best and most economical way of using manures is in a pure state, remembering you are playing with fire. Do not condense in one place but scatter well and mix well into soil and use little often rather than much infrequently.

White Poinsettias

An occasional inquiry comes in respecting White Poinsettias but we do not recommend their purchase except as curiosities. More than a dozen years ago I secured one, but it was disappointing in that it was constitutionally weak as are all white sports from natural reds and the bracts were not white, but of a vague creamy-grey, often with a tinge of pink. They will never rival the common scarlet.

Lily of the Valley

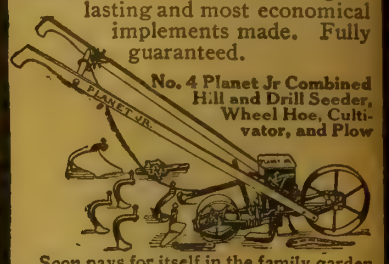
A neighbor of mine has had fine success this year with lily of the valley in ordinary garden soil and under rather ordinary conditions, except in one respect. The garden faces northeast and along the southeast side is a skirt-board which forms the bottom of line fence, sticking above the soil about ten inches. Behind this and but three or four inches away the bulbs were planted. There the sun never reaches the roots and only a few inches of the top are exposed to sunlight at any time. Such conditions are ideal for many plants. When clematis roots are in cool shade and the tops reach sunlight these plants thrive splendidly everywhere.

Substitute for Box

In place of box for borders, hedges, or vase plants, use a privet that in local market is found under the name of Ligustrum nepalense. It has small box-like leaves, is hardier than the box under any treatment or conditions, is subject to fewer pests and diseases and if injured will more quickly replace damaged parts. It is more easily grown, transplanted, and maintained, and is cheaper; also handsome. Why then stick to box? Do not be a slave to established precedent. Personally I do not now care for box, for we have better plants for any and all purposes.

Planet Jr. Seeder-Horse Hoe

The farm and garden tools that save your time, lighten your labor, and get bigger crops—the longest-lasting and most economical implements made. Fully guaranteed.



No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator, and Plow

Soon pays for itself in the family garden as well as in the larger acreage. Sows all garden seeds (in drills or in hills), plows, opens furrows and covers them, hoes and cultivates quickly and easily all through the season.

No. 8 Planet Jr Horse Hoe and Cultivator

Stronger, better-made, and capable of a greater variety of work than any other cultivator made. Non-clogging steel wheel. Depth-regulator and extra-long frame make it run steady. Adjustable for both depth and width.

Prepare for Fertilizing

After one more good soaking rain use fertilizer freely on both garden and lawn, especially stable manure, all the richness of which cannot be so quickly washed away as that of commercial fertilizers. Do not allow stable manure to stay too long upon grass or it may result in killing some roots directly and others indirectly through burning or bleaching away the grass, leaving tender roots exposed to a possibly fierce sun in case of a hot spell. After watering manure coverings well, rake off and work the rakings into the garden soil or use for mulch elsewhere.

Study Plant Literature

Read all you can on the subject of the garden—books, magazines, plant departments, catalogs—anything available. All are helpful, no matter how much practice you may have had. I never knew but one good gardener who could not read. He lives in Los Angeles. But his wife and children have read to him patiently all he has taken home, and he has taken home everything in garden literature he could buy, borrow, or obtain free. He is well posted and successfully passed a recent civil service examination wherein the written part was set down from his dictation. Books made him what he is; they will perfect anyone in any calling. Study all phases of gardening and you cannot help but succeed.

War Affects Prices

Reports from large Eastern centers show conclusively that some prices of plants are affected by the war in Europe. This is the case with my favorite, the gladiolus. Wholesale prices are a little lower than ever before and this should result in a wider planting, somewhat this year and more next, for prices will not go up for at least one year. Plant some of these bulbs now or within the next few weeks. Also plant them deeply. In light soils put them down six inches. They grow better and will not need staking. Bulbs put in shallow will result in tops falling over when soil is very wet.

Small Fruits Vegetables

CHILI CULTURE

By Fabian Garcia, New Mexico College of Agriculture

UNDER good care on good soil and with a good stand, an acre may produce as high as 15,000 pounds of green chili; while last season some of the strains tested produced at the rate of over 8,000 pounds of fresh, ripe chili per acre. Upon drying this was reduced to slightly over 2,100 pounds, or to about 27 per cent. In other words, there was about three-fourths of the weight of the fresh red chili water. Two thousand pounds of dried red chili may be considered a good yield; particularly so if the price of this product remains as it has during the last few years at ten to fifteen cents a pound wholesale.

Best to Transplant

In growing this crop two methods are in common practice. It can either be started from seed planted in the field or from plants transplanted to the field, which have been started in cold frames or hotbeds. Everything considered and wherever it is possible the transplanting method is the better. If this method is to be followed the seed may be started in a cold frame or hotbed about the last of January or first of February. By about April 1 the little plants are usually large enough for transplanting. In transplanting to the field two to three plants are set to each hill. The hills are two feet in the row, by three and one-fourth to four feet between the rows.

Preparation of the Land

After the land has been thoroughly prepared the rows may be marked off; usually by plowing out a small furrow with a small plow which is used for irrigating the plants, the transplanting being done on the side of this small furrow. As the plants grow and the middles are cultivated the dirt is pushed over towards them so that by the time they begin to bear they are practically in the middle of a ridge. It is considered a good plan to cultivate in such a way as to throw the dirt towards the plants as they grow. The later irrigations are then given through the furrows or between the ridges. The chili plant will produce as long as it is kept growing vigorously. If it lacks water it will stop growth and quit bearing.

The more common method of growing the crop is by planting the seed in the field. The same distance between the plants and between the rows as have been given for the transplanting method may be used when the seed is planted in the field. About a dozen seeds should be enough at each hill. They should not be planted any deeper than tomato seed. When the crop is growing from seed in the field it is planted on ridges at the edge of the water mark. Sometimes it will require one or two irrigations to complete germination. Frequently the winds are very severe on the little plants which are just coming up. Sometimes field mice will dig out the little seeds, so that in order to have a fairly good stand it is necessary to reseed. If all seeds germinate the hills should be thinned out to two or three plants. Better and larger pods may be had from two to three plants to the hill than from half a dozen or more.

"THE TRIPLE ENTENTE"

Commenting on the power of the American press, Peter Radford, lecturer of the National Farmers' Union, states that "the press, the church and the school form the triple alliance of progress that guides the destiny of every community, state and nation."

"Without them civilization would wither and die," says Mr. Radford, "and through them life may attain its greatest blessing, power and knowledge. The farmers of this nation are greatly indebted to this social triumvirate for its uplifting influence, and on behalf of the American plowmen I want to thank those engaged in these high callings for their able and efficient service to the farmers of this nation."

General Agriculture

JAPANESE PLANT IMMIGRANT

A PLANT immigrant from Japan that seems likely to prove a most desirable addition to American agriculture is the adsuki bean, which has been successfully grown on the government's farm at Arlington, Virginia, and at many other places. Its most valuable feature lies in its large yield of seed. Owing to its texture the bean is easily ground into meal or flour and has proven far superior to any other bean for that purpose. Its flavor is delicate and it lacks any objectionable "beany" taste. The adsuki bean is a most popular food in Japan and there seems no reason why a food so rich in protein should not become popular in the United States.

The first adsuki bean brought to this country most probably was the "red-seeded bean" which Commodore Perry brought back in 1854 after his famous trip to the Far East, when he first established communication between this country and Japan. It has not been, however, until comparatively recently that the bean was experimented with in a scientific manner in America. In 1891 the Kansas experiment station had the beans submitted to several housekeepers for trial, and their recommendations of it were in general most favorable. The United States department of agriculture is now giving a detailed description of its experiments with the bean in a new bulletin (No. 119), "Five Oriental Species of Beans."

The average yield per acre of the vest varieties of the adsuki bean at the government's farm has been about 25 bushels. The bean is a summer annual requiring about the same climatic conditions as the common bean. The plants are bushy in habit, growing from one and a half to two feet high, according to variety and soil. The beans are not only prolific but ripen evenly and do not shatter readily. It has been evident that these beans cannot compete with either cowpeas or soy beans as hay producers. Their initial growth is slow and their total yield of herbage inferior.

In Japan the adsuki commands a higher price than any other bean, the varieties with maroon-colored seeds being most largely used. In every Japanese city are shops where adsuki beans and adsuki bean meal are sold and among the most common cakes and confections are those made wholly or in part from adsuki bean meal.

Adsuki bean meal is sometimes prepared simply by grinding the dry beans and then removing the seed coats with sieves. More commonly, however, a wet process is employed. The wet process seems to vary somewhat in different parts of Japan, but consists essentially of four stages: Boiling the beans until soft, usually after a preliminary soaking; crushing the cooked beans; removing the skins by forcing the mass through sieves or by putting the bean paste in cold water, when the skins are easily separated; drying the bean paste.

A modification of the above process is to remove the seed coat from the soaked and parboiled beans before they are crushed. In boiling the red color of the seed coats dissolves, and on this account the water is sometimes changed once or twice. The final product is somewhat reddish, however. The bean meal in whatever way prepared is eaten in soups and gruels of various kinds, often sweetened. It is also used for making various kinds of cakes and confections.

Popped Adsuki Popular

Adsuki beans are also eaten popped like corn as a coffee substitute, and candied by boiling in sugar, the last product being called amanatto. The flour is also used for shampoos and to make facial cream. The use of beans to make sweetmeats seems to be purely a Japanese invention, as there are no similar foods used by Europeans or Americans.

IMPORTANT SOURCES OF ELEMENTS IN COMMERCIAL FERTILIZERS

Present agricultural practice prescribes the use of three chemical elements as a "soil amendment," a "stimulant for plant growth," or a "plant food," as it is variously put. These three elements when applied to the soil in which a crop is growing have been found by practice to afford an increased crop yield. They are phosphorus, potassium and nitrogen, spoken of by the respective trade terms of phosphoric acid, potash and ammoniates.

In the commercial fertilizers phosphoric acid is found in the form of calcium phosphate which is bone phosphate or rock phosphate, usually treated with sulphuric acid to render it soluble. Potash is found as a salt or salts of potassium, either sulphate or chloride and the ammoniates as the inorganic salt of ammonia, ammonium sulphate, the inorganic salts of nitric acid, sodium nitrate, and inorganic compounds of nitrogen, calcium cyanamid, or the organic compounds of nitrogen, contained in animal or vegetable refuse matter, cottonseed meal, abattoir tankage or fish scrap.

The usual commercial fertilizers contain these three elements and have the designation of complete fertilizers. These are sold under vari-

Here's What Satisfied Customers Say About "R&W" ORANGE TREES Read This:

"Exeter, Cal., Nov. 27th, 1914.

"Gentlemen:—

"In 1906 I purchased from you 2160 Washington Navel Orange Trees and planted same on my 20-acre place 1½ miles southeast of Exeter. My orchard has made a remarkably fine growth and the fruit is not only the very finest type of Washington Navel, but my trees have borne regularly and they produced oranges, most of which have been marked as extra fancy.

"The trees came into bearing three years after they were planted, and they have done so remarkably well that it is always a pleasure for me to recommend any of my friends, in case they want trees, to buy Roeding & Wood stock.

"As I have stated before, the quality of my fruit has been the very best, but this season, now that the trees are practically at an age where you might say they are in full bearing, I am not only very proud of my orchard, as there is none better in the country, but I am confident that I will receive returns from the fine crop of golden globes that I am getting that will repay me handsomely for the care that I have given this orchard. **I estimate my crop this season at six to seven thousand packed boxes.**

"Yours very truly,

"(Signed) L. L. THOMAS"

CITRUS Trees —the finest stock ever grown.

We have for this season's planting a splendid assortment of all the leading varieties of oranges, lemons, pomelos, limes, etc., and can fill your orders complete with almost any quantity. Our stock is all grown in the choicest spots of California, under ideal soil and climatic conditions, from buds of select strain—the kind that produces premium fruit.

In addition to citrus trees we also make a specialty of Olives—Manzanillos, Mission, etc. Ask for prices.

Olives

We can supply you with all the leading varieties of deciduous fruits such as apples, pears, peaches, plums, etc., as well as ornamental stock.

Deciduous Fruits

ROEDING'S FREE ADVISORY SERVICE

We offer to every purchaser of our nursery stock a special service to aid in the growing of premium fruit. Our Mr. Roeding has had over 30 years' experience in California horticulture, and you receive the benefit of his advice free when you purchase from us. Write for further details—or ask for our 1915 illustrated price catalog.

ROEDING & WOOD NURSERY CO., INC.

J. D. MERIWETHER, Manager.

1607 E. Washington Street LOS ANGELES, CAL.

ous brand names, the various brands frequently being recommended for particular crops. The proportion of the three essential ingredients is varied; as a usual thing that of the phosphoric acid in considerably higher than the other two, which are present in about the same proportion. Thus for example, a "6-2-2 mixture" contains six per cent phosphoric acid, two per cent ammonia and two per cent potash. Its selling price in the retail market is based on its analysis. Little attention is paid to the source of these ingredients so long as the essential compounds are available or readily may be decomposed or made soluble for the use of the plants.

The nation's supply of these three common ingredients of fertilizer may be summarized as follows: Of phosphoric acid there is an abundant supply in the large deposits of phosphate rock of Florida and Tennessee and the enormous deposits of Idaho, Montana and Wyoming.

Of potash, now obtained exclusively from the German mines, there is little known in this country outside of the desiccated residues in Searles Lake, California, and the giant kelps of the Pacific littoral. In the latter there is much more than enough to supply the present demands of the fertilizer trade of the United States, the present annual consumption of potash being about 1,250,000 tons, of varied composition. At present the kelps are not supplying any of this, since it has not been determined by actual experimentation on a commercial scale that they can be used economically as a source of potash. Estimates based on costs of similar operations indicate that they can be so used.

Of ammoniates there is a large source in the ammonia produced as a byproduct in the distillation of coal for the production of gas or coke, or both. This source is but partially developed, as by the methods most commonly practiced in this country this possible byproduct is not recovered. The amount of ammonia now going to waste is almost large enough to supply all of the ammoniates now demanded by the fertilizer trade. The abattoirs supply a large amount of tankage and dried blood of high fertilizer value; but of these possible byproducts there is still an enormous loss through the lack of organization and cooperation in the small scale slaughter of animals for food.

TIPS TO AUTO OWNERS

Drive your car steady and true. Slewing and skidding are evidences of bad driving just as much as allowing a horse to stumble or fall is evidence of unskillful horsemanship.

Many a walk home has been avoided by making a hurried examination of the engine, the carburetor and other working parts before the car was started.

Study the roads you cover. Deep, hard ruts make hard going and wear the sides of the tire. Watch for large, loose stones. A simple turning of the steering wheel will save the tires numerous scratches in the course of a year.

Plug small cuts down to fabric to prevent wetting and sand separation of thread.

Quick headway and hard brake-stop driving is destructive to tires just as "crack the whip" start and sudden stop ruins horses' tendons and ankles.

An excellent way of reducing the wear on the coil vibrator points with battery ignition is to reverse the direction of the current flow through the system.

Sometimes the bolts securing the flywheel to the flange on crankshaft work a trifle loose and as a result there comes an irregular knock hard to distinguish from a loose connecting-rod big end. This flywheel knock will be more noticeable at slow motor speeds or when the engine is being accelerated or retarded.

A small operation, such as placing a spark plug in its appointed position, has possibilities for going wrong. For instance, it is possible by accidental contact with the cylinder wheel to knock the points out of adjustment, the result being misfiring or the entire refusal of the motor to start.

The body of the car should be washed with clear water only and the sponge used absolutely free from grit of any kind, otherwise the finish will be marred and the lustre destroyed.

Extreme care should be taken to avoid getting dents in the bodies of metallic body cars, as it is practically impossible ever to get these out without destroying the finish.—Better Farming.

SUDAN GRASS

Sudan grass belongs to the sorghum family, and is considered by some authorities to be the wild, original form of the cultivated sorghums. It is a tall annual grass, being somewhat like Johnson grass in general appearance; but it lacks the rootstalks of the latter, and never becomes a weed. Under favorable conditions it may attain a height of six to ten feet. Its growth is dependent to some extent upon the method of seeding and the amount of moisture in the soil. If sown broadcast it does not grow so high as when planted in rows which permit of cultivation.

Sudan Grass is particularly well adapted to the dry land sections as it produces good yields of hay, and under average conditions should produce two cuttings of hay in a season. It is very drouth resistant and will succeed where it is possible to grow any other sorghum.

In feeding value, Sudan Grass can be compared with the millets, making a large crop of hay during the warm weather. Hay made from Sudan grass is preferable to millet hay as it can be fed to all classes of livestock without injury. The stalks are fine and can be readily cured into hay.

The crop may be grown either drilled, in cultivated rows or broadcasted. If drilled or broadcasted, from ten to fifteen pounds of seed is sown per acre, while if planted in cultivated rows, the rows being about thirty inches apart, two to three pounds of seed should be used per acre.—James D. Marshall, Colorado Agricultural College.

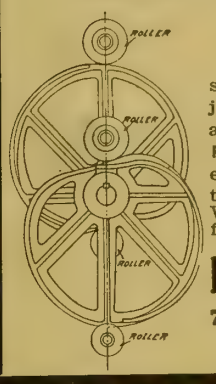
Luitwieler Pump The "Peer" Of All Pumps

With Heart-Shaped Cams of Everchanging Radius—Giving a Steady, Even Pressure to the Water Delivery



In ordinary pumps the radius of the cam remains the same. This causes the plunger to vary in speed, causing jar, vibration and strain which greatly lowers the efficiency and lessens the life of the pump. But with the Luitwieler Pump there are none of these troubles. The cam has an even changing radius, resulting in a perfectly even application. Less power is required, and the efficiency is greater. We have yet to hear of a "worn out Luitwieler." Write for Catalog No. 12.

THE FRESNO NURSERY CO. INC. TRADE MARK FRESNO QUALITY SERVICE FROM THE ROOTS UP

Nursery Stock

Fair and **Square Treatment** of our Patrons has built up our business.

The Class.

We grow and sell the best NURSERY STOCK money can buy. Our trees and GRAPE VINES are of the best strain, healthy, well rooted. Our packing methods perfect, insuring safe arrival. If you are in the market for APPLES, PEARS, PEACHES, PRUNES, PLUMS, CHERRIES, APRICOTS, FIGS, CITRUS TREES, GRAFTED WALNUTS, OLIVES and GRAPE VINES, write us and submit a list of your requirements for quotations. Large 52-page Catalog mailed for the asking. We also grow and sell

PALMS, ROSES, ELMS, BALM OF GILEAD and Hardy Ornamentals.

This is an ideal planting season. Write us your wants, we do the rest. ***Address***

The Fresno Nursery Co., Inc.

1824 Tulare Street, Fresno, Cal.

"Behind each tree is our guarantee"

Our name and guarantee stands back of every tree leaving our nursery. We specialize on foothill grown stock for hardiness, good, well branched roots, freedom from root knot and disease. They are superior to and unequalled by those grown in any other soil or location.

TRUE TO NAME

THE SILVA-BERGTHOLDT CO. CALIFORNIA FRUITS NEWCASTLE, CAL. TRADE MARK REGISTERED

REMEMBER
When you purchase
Silva-Bergtholdt Trees
you buy from a firm who are fruit growers and shippers as well as nurserymen.
Our buds are selected for propagating only from parent trees having the best record for quality of fruit and productiveness, thus insuring a pedigreed tree. Our years of experience, knowledge and observation in horticulture are at your service. We show you how to succeed.

Write to-day for our Fall Catalogue
giving accurate description of each variety and valuable suggestions as to tree planting.

Order now while the assortment is still fairly complete.

The best varieties are selling rapidly. Don't wait too long.

ALMONDS
Plant Almond trees for profit. California has a monopoly of the American market, which demands four times the present supply. We have an extra fine lot of trees in all the standard varieties on Bitter Almond and Peach root.

WALNUTS
Mayette—The true Wiltz strain for productiveness, freedom from blight, and quality, has no equal in any of the other standard varieties.
Franquette — The true vrooman strain, next to the Wiltz Mayette. The best Walnut for Northern and Central California. Our scions of Mayette and Franquette are absolutely of true strain, cut from selected trees.

CLINGSTONE PEACHES
California Canned Clingstones have a monopoly of the markets of the world for the reason that Eastern grown Clingstones can be canned only for pie fruit.
Tuscan — Are our improved round Tuscan; firmer; more symmetrical; more productive; not subject to windfall and split-pit and preferred by all canners to the Oblong Tuscan commonly propagated.
Phillips—We cut our buds from a block of trees that have proven of an exceptionally good strain of this variety.
Levi—A fine late Cling and desired by many growers to prolong the canning season. Very productive.

Our trees received first prize and gold medal at the State Fair.

OLIVES
Our Mission Olives are worked on Picholine root. The Picholine is a stronger growing and a deeper feeding root system than one grown from cuttings. Plant Olives only on Picholine root.

PRUNES
Prunes are a staple money maker. Our parent trees of French, Imperial, Sugar and Robe de Sargeant have been selected for quality, productiveness, and size of fruit.

PEARS
The California Bartlett monopolizes the markets of this country and Europe. The opening of the Canal route reducing the cost of their transportation East and for Export by one-half, will create a demand for the California Bartlett and California grown Fall Pears that the present planting cannot supply. We have a fine block of Bartlett, Comice, Winter Nelis, Anjou, and other varieties. Buds are cut from selected parent trees.

CHERRIES
The first and best fruit of the summer season, grown only in California during their season of ripening and more profitable even than Oranges in Riverside County. Don't miss this fruit in your planting.

APRICOTS
Apricots being another fruit grown successfully only in California. Have a monopoly of the American market, and canned and dried the export demand is unlimited. We have a fine lot of trees in the standard varieties—Royal, Blenheim, Moorpark and Tilton on Peach and Apricot root. They are selling fast.

Write to-day for our catalogue, price list and full information about planting—it's free.

Irrigation Forestry

WATER FOR DOMESTIC USE

A PURE water supply for home, farm and stock purposes is imperative for every household but it is a curious fact that until recent years the water problem was not given the serious consideration that the public health demanded. This fact has formerly been especially true in small cities, towns and villages, and throughout the farming districts. While there should be no excuse for this fact, there unquestionably have been reasons for it.

One reason has been the ignorance of the average man regarding the conditions affecting the water supply, and what constitutes pure water. Another reason has been that the population has increased so rapidly, people have not realized the effect this increase was having upon the water supply by reason of its effect upon the soil through which practically all water used in domestic supplies must pass. One would hate to presume that any man once familiar with the conditions affecting the water supply at his home would for the sake of a few paltry dollars risk the life of his family, his neighbors and himself.

Surface Supplies Considered Safe

Years ago before the country was so thickly settled and before the forests had practically disappeared spring water was depended upon for the supply in the majority of cases.

The pioneers invariably located their homesteads adjacent to a spring, and when a spring was not convenient, adjacent to a creek or river, and used these supplies for their domestic water. When a spring or a creek was not available wells were dug, usually to a shallow depth of 15 or 25 feet, and in the earlier days the supply of water furnished by the dug well was in many cases practically a pure supply.

One can readily understand that in a new land where animal life is comparatively rare, where there are no yards that are made more or less filthy by the excrement of domestic animals and where the increased population, throwing off its filth, does not exist, such a condition will furnish a surface supply that is comparatively good.

Surface Supplies Become Contaminated

With the increase in population came the natural increase in animal life, livestock, barns, privy vaults, outbuildings, etc., and the soil surrounding the water supplies, especially the shallow wells which were usually located convenient to both the house and the barn, and in a low spot, became contaminated.

All who read this have seen and can call to mind one or more, probably many, of the old fashioned dug wells or even springs that were situated in an ideal location for collecting through drainage practically all of the impurities from the house, privy vault, barn and pigpens, for nature naturally locates springs in positions where these conditions will exist, and man, when compelled to use shallow wells or surface water supplies naturally follows the laws of nature.

Water, being the best solvent known, when coming in contact with dead vegetation, dead animal life, refuse, etc., dissolves it and carries all manner of impurities in solution; naturally surface drainage carries these impurities into the soil and through the soil to the water supply.

All diseases that can be traced to, and which are carried by water, increase accordingly. Contaminated or impure water may not make itself known by any taste or smell. Nothing but careful analysis will determine whether water is pure or not. Every now and then there is an outbreak of typhoid or some kindred disease and the question arises, whence has this disease come? A careful search will usually trace it to some shallow well or surface water supply.

Typhoid Fever

It hardly seems necessary to point out to the average intelligent man the danger which lies in a water supply secured from a dug, shallow well or surface water supply.

Typhoid fever cannot be contracted without taking into one's system germs that have been voided by a typhoid patient. These germs get into the body through the mouth, pass through the stomach into the intestines, and are carried through the body by the blood. They leave the body through the bowels and are in the urine. Sometimes infection is carried by contact or through vegetables and milk; but the common channel of typhoid transmission is through our drinking water supply.

It is conservatively estimated by eminent medical authorities that 75 per cent of all primary typhoid fever cases are caused by impure drinking water. Lewis Edwin Theiss makes the following statement: "Typhoid fever alone causes an actual loss in the United States of $200,000,000 a year." This estimate is without question too conservative.

"Even malaria, which is commonly carried by mosquitoes, may also be conveyed by polluted water. This was shown by an experience related by Prof. W. A. Mason of the Rensselaer Polytechnic Institute that befell the people of Hawkinsville, Georgia, a town in a malarial district. Chills and fever were so customary that people expected the disease every fall. But a change in the water supply from surface water to artesian well water completely freed the town of malaria."

Quoting further from the same article we take the following: "Quit taking chances with your drinking water. Right now, wherever you live, you may be drinking water from a supply which has filth poured into it through one side while through another it is pumped out for you to drink. As a result one disease alone, typhoid, needlessly fastens itself on 250,000 American men and women every year. And 370,000 babies less than five years old are annually sacrificed to impure water.

"Criminal negligence is the sole and only cause of such a condition. We dig a cesspool and well in the same yard, and the contents of the one seep

through the earth into the other. We place a privy vault a few feet from our well hole, and the rains wash the filth from the former into the latter. We defile the surface of the ground so that every rainstorm sweeps the defilement into our source of supply. Did you ever stand at the edge of a barnyard and watch the rain falling from the roof of barn and pigpen to the manure piles below, slowly accumulating pools of reddish black and draining away into some one's drinking water? Or have you ever stood by a river bank and watched a sewer belching forth its infinitely more harmful human corruption? The idea of drinking such nauseating stuff is not pleasant; but that is exactly what millions of us are doing."

Effect of Pure Water

Mr. Allen Hazen, an eminent American engineer, says in his book, "Clean Water and How to Get it"; "The reduction in the number of deaths in five cities, brought about through water purification, amounted to 440." Improved general sanitary conditions, he says, were responsible for 137 of the 440 decrease. The typhoid reduction in the number of deaths from other causes amounted to 232—three times the typhoid reduction. If this ratio of deaths due to water holds good generally then our typhoid deaths are only a small part of the deaths due to bad water.

Water used for domestic purposes should never under any circumstances be used from any strata above hardpan and it is much safer and more dependable to go on through the hardpan and cap rock to the water-bearing rock or water-bearing sand or gravel beneath the rock strata.

Either the hand pump, elevated storage tank or pressure system, when supplied from a deep drilled well, obtains the water from the never-failing stratum in the rock or in the gravel beneath the rock, furnishes a pure, wholesome, sparkling water that has been purified and freed from bacteria by filtration through the sands and rocks of the earth and is a much better investment from every point of view than any other form of supply.

Pure Water Supply Through Drilled Well

In practically every part of the world it is possible to obtain a pure and wholesome supply of water. To prove this fact it is only necessary to refer to our own great desert lands which a few years ago were considered worthless but are now being reclaimed by irrigation through drilled wells. In many cases artesian or flowing wells are found in these same deserts. The depths at which these pure and unfailing supplies of water are found vary in different localities, but it is apparent that nature has practically everywhere provided us with an ample supply which we should take advantage of. The drilled well is conceded to be the only satisfactory and successful method of obtaining a pure and unfailing supply of water in all places.

Get a Drilled Well of Your Own

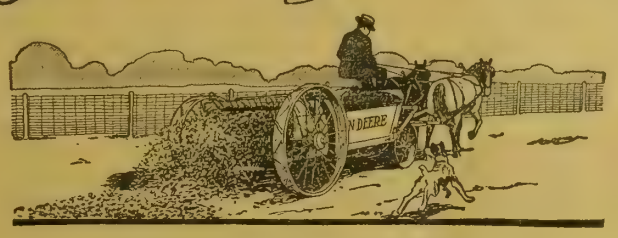
If you do not have one, sink a well on the place now. The sooner you do it the safer will be your health and the health of your family and neighbors. Be sure it isn't a shallow well. Go down to the inexhaustible pure water for your supply. It never goes dry when you need it most. It does not bring illness and death into the family and it furnishes the coolest, purest and best water the earth can supply.

HOW FARMERS SHOULD ORGANIZE

The department of agriculture is continually receiving inquiries from all sections asking how farmers ought to organize. The answer to such a general question must necessarily be that it depends partly upon the particular needs of a given community and partly upon the capacity which farmers have to establish and manage the work of a suitable organization. There should be a strong local feeling of the need of some improvement and that certain definite aims or purposes can be more fully realized with the aid of organized interest and activity than through individual effort alone. It is folly to expect that mere organization, as such, will achieve a given object, unless the farmers organize in the right way and equip their organization so that it will carry on its work efficiently. Having decided that an associated effort is warranted by the needs of the community, a study should be made of the kind of organization that would be most helpful and the ways and means of making its work effective. While this calls for intelligent, enthusiastic and self-sacrificing leadership, it is best that this be furnished locally. Organizations may need outside advice, but they should not be promoted by outsiders. The farmer's advance must come as the result of his own efforts; his progress must develop from within rather than from without. The organization that is given him is of far less value to him than the one which he himself creates. In the matter of securing advice it is generally wise to make application to the agricultural college or the proper government official. In asking for this advice a full statement of the local situation should be given—the territory to be included, number of farmers interested, class and amount of work to be undertaken, previous cooperative experience, and any other local features that will give a definite idea of the problems that must be met in outlining a plan of organization for the betterment of the community.

A long whip never made a man a good driver.

John Deere Implements



John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of the spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You can't get it on any other spreader. The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

Write for more facts. Also ask for "Farm Manures and Fertilizers", a valuable textbook you can get free.

John Deere Wheel Plows

With Quick Detachable Shares
Unscrew One Nut—That's All

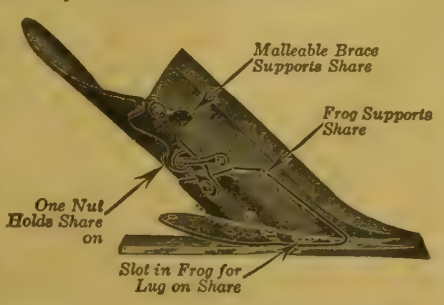
John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

Here are some advantages of these shares:

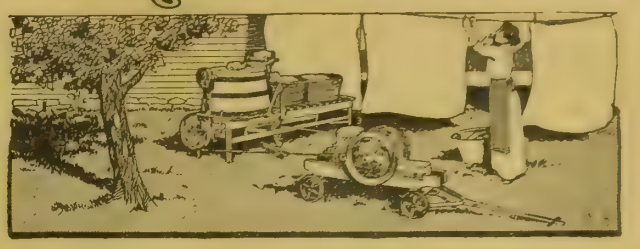
1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang (High Lift Frame Plows)
John Deere Stag Sulky and Gang (Low Lift Frameless Plows)
John Deere Two-Way Sulky (Side Hill or Irrigated Land)
John Deere Engine Gangs (For Traction Engines)



Mention the booklet above that you want and we will send it to you free.



R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

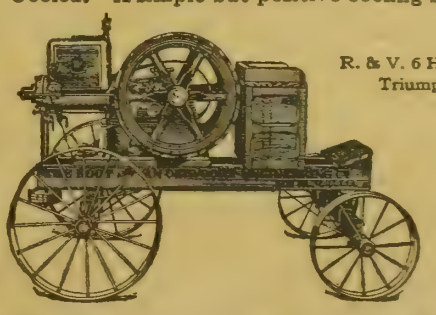
The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

They are dependable gasolene engines—always develop rated horse power.

R. & V. 4 H.P. Triumph

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

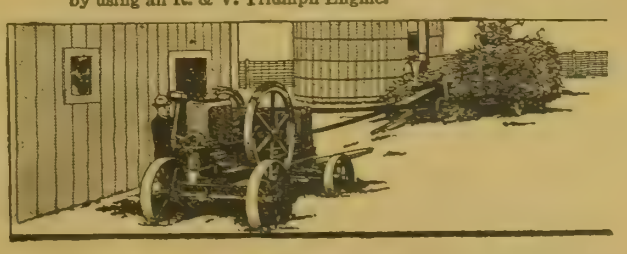
Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.



Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X111

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

LET GASOLINE DO IT

An eastern correspondent has written suggesting that at this time when agents of European nations are picking up all the American horses they can purchase the farmer take advantage of the opportunity to dispose of his horses and let gasoline do it. One point raised is that it is possible the work may be done more economically with the tractor and other farm powers, but it will reduce the consumption of oats and other farm produce by horses and give the country a greater quantity of food stuffs to export. There appears to be no immediate danger of superseding the trusty draft horse when it comes to farming operations, but we doubt not the present time will see a greater increase in the use of farm power.

CHEAP COTTON

Cotton growers have been watching the markets, especially the manipulations of the cotton market by the "exchange." When May cotton was selling at seven cents the growers took their pencils and found by a little figuring that the cost of production was approximately nine cents per pound. Some of the shrewder ones concluded to stop growing cotton and buy futures on the stock exchange for two cents less than the cost of production and make some easy money. New York gamblers have made money from the cotton growers since cotton was grown; perhaps now the growers can turn the tables and make money from the gamblers. We suggest, however, that the growers wake very early in the morning, seven days in the week. The gambler has the privilege of setting the price; the grower has been denied that satisfaction.

More seriously, the whole miserable matter is proof that our markets are not controlled nor manipulated in the interests of the producers, but entirely for the benefit of large moneyed interests which are willing to make their living in the same way as does the common gambler.

FINE FRUIT

Not an orange has been frozen in California this year. The finest fruit ever has gone forward; some of it has brought fair returns to the grower; some, indifferent returns; and some, because of weather conditions east of the Rockies, has been drowned in red ink. Two years ago our own weather conditions caused serious losses. So it appears that either coming or going the orange grower is in danger of "getting his." The finest fruit has gone from California only to be caught on a siding in some Eastern blizzard-swept plain and frozen as hard as rocks, in spite of refrigerator cars. Of course some cars found roundhouses and a degree of protection, but with 600 or 800 cars in transit or on Eastern tracks, it was impossible that any large proportion of it could be protected. Compared with the total of forty or more thousand carloads, the loss will be small, but it will fall heavily on some. It is to be hoped that financial conditions will improve so that the bulk of the crop which is yet to go will command fair prices.

BETTER ROADS

America has had the reputation of having about the worst roads in the world. The perfection of European roads has been dinned into our ears until it has seemed we were always wallowing in the mire or riding over the bumps and ruts. But if the campaign of the last few years is continued it will not be long until America will show the finest road system of any section in the world. The best of it is that of all the states California, in proportion to her wealth, is doing the greatest amount of road building. In addiion to the work being conducted by the state highway commission, almost every county has voted or is considering voting on large bond issues for good road building. The feeling that this agitation has been in the interests of the automobile dealers and the automobile owners is subsiding, for the producer is finding that the benefits accrue to him to even a greater extent than to the pleasure seeker. His harness is repaired less; his horses travel on smaller feed and carry larger loads. In other words, the cost of getting products to market is vastly lessened, and as this truth is appreciated the farmer will appeal for more good roads and be willing to pay his share. Perhaps he has paid more than his share in the past, but it will be observed that nearly all municipalities are willing to help finance the building of county roads. Every city is benefited by cheap and better transportation facilities.

SERIOUS DISEASE

Stock breeders of many Eastern states have suffered serious loss because of the foot-and-mouth disease. The greatest loss of all, however, has been suffered in the state of Illinois. In that one state over 500 entire herds, many of them of pure-bred stock, have been slaughtered. In some of these herds strains of blood which breeders had labored almost a lifetime to build up have been destroyed. The compensation is merely nominal, for while the department of agriculture and the state are supposed to divide the loss, they have established values on a meat basis, and owing to local complications the state has not been able to make any appropriations. The federal government has paid only in promises. Sometime it is presumed that the government will make good in the payment of half of the meat value, but the wheels of the federal government move exceeding slow.

But the greatest loss comes from inability to move any stock. No matter how much stock ready for market the farmer may have, the quarantine regulations have been so strict that he has been prevented from selling a dollar's worth. On the other hand, he has fed many a dollar's worth of high-priced feeds. These severe losses have caused a restive condition among the stockmen and farmers, especially in view of the fact that the disease has not shown any very serious results to the stock, all attacks have been light. But the agricultural department of Illinois issues a statement that the disease is a far more serious one than any other affecting animals, including tuberculosis, cholera and others of the most deadly. There is only one position for our federal department to take in the matter—and that it has been taking consistently—to quarantine and slaughter until the disease is absolutely stamped out. It has been done before and it must be again. California and all other states which are as yet free from the disease must maintain an effective quarantine.

GET READY

The Fresno Republican raises the point that California needs fewer colonists or else more colonization enterprises. The state has been appealing for new settlers since it became a state, yet in all that time no preparation has been made for the class which is needed here more than any other. Every chamber of commerce or promotion organization within the boundaries of the state has appealed for the man with means but has made no offers to place the man with only his bare hands, intelligence and integrity. The Republican calls attention to an instance where an official of a promotion organization was appealing for settlers. He was asked, "How many people can you use in your county?" and he answered immediately, "Five thousand." The reply was made to this that there were only an even dozen seeking an opening. Then the question came back, "How much money have the twelve?" They were without any, and for them the promotion agent had no use.

These twelve men are looking for a chance to earn money, but for them there is no opportunity in this state. California has the natural resources to create opportunities for just such people; its banks are filled with idle capital; it has brainy men who are able to make right conditions for these laborers to create wealth for themselves and for the state. There have been one or two development propositions which offered opportunity for the man with a little means, but none for the man without. In other states, Oregon for instance, banks have united and made purchases of pure-bred livestock which have been turned over to farmers on nominal payments, other payments to be made monthly or as could be arranged. Canada is providing high-priced, pure-bred stock for its colonists, to be paid for by fees during a period of years. The greater proportion of California's farming lands is held in ranches of 1,000 acres or more. This means limited population and limited prosperity. If we want the millions which the state can support we must plan to receive them rather than make our plans to receive only the wealthy or the well-to-do.

Agricultural Notes

The foot and mouth disease is now reported as under control in every state in the Union save Illinois.

The engineers who made preliminary surveys for a government railroad in Alaska have returned and have made an informal report to President Wilson.

The railroads will not now accept freight for delivery to steamships in European trade unless the shipper already has a reservation on the steamer for it. This is to prevent further piling up of freight on wharves and in warehouses.

A state trade-mark for butter is the objective of the dairy interests of Iowa, and the matter will probably be brought up before the legislature. The idea is to have a trade-mark which can be used on all butter having a score of at least 93 points, according to the system adopted by the state.

The "Made in the U. S. A." campaign is being taken up seriously by the chamber of commerce of the United States and by local chambers throughout the country. The Detroit chamber of commerce has offered a prize for the best design for a label to carry the legend "Made in the U. S. A."

The Rural Organization Service is the latest division of the United States department of agriculture. Dr. Thomas N. Carver of Harvard University has been named as the head of the new service. Its functions include studies of markets and distribution of farm produce and also the social welfare of country people.

A piano manufacturing concern in Chicago has found out that it can ship in carload lots to New York and then by the canal to the Pacific Coast cheaper than by rail from Chicago to the same point of destination; and that shipments of household furniture from Rockford, Illinois, have moved to Pacific Coast points by the same route.

Senator LaFollette has introduced in congress a resolution aiming to nullify the action of the interstate commerce commission in its recent order allowing a general increase of five per cent in freight rates. The resolution declares that the commission did not make sufficiently thorough inquiry, and that the increase was made without good reasons.

The first prize winner of the recently closed North Dakota Pork Production contest is a girl. The object of the contest was to prove that a marketable hog can be produced in about seven months. The 24 boys and girls winning prizes in the contest produced hogs averaging 210 pounds at an average price of two and three-fourths cents a pound. The winner of first prize produced 3,811 pounds of pork from a litter of 14 Durocs in 209 days.

The United States geological survey is national in scope as well as in name. In the year ending June 30, 1914, geological investigations were conducted in 47 states, Alaska, Hawaii, and the Canal Zone; topographic surveys were made in 35 states, Alaska, Hawaii; and stream measurements were continued in 39 states, Alaska and Hawaii. The total area covered by the geologists in reconnaissance and detailed surveys was more than 75,000 square miles.

Agricultural News Notes of the Pacific Coast

Northern California

Mt. Lassen is having another eruption.

The rice mills at Biggs, Butte County, are running full time.

Yolo County is to make exhibits of its oranges at the P. P. I. E.

One Sutter County farmer will plant 100 acres of English walnuts.

California shipped 12,000 carloads of vegetables out of the state during 1914.

The farm center at Combsville, Napa County, held an interesting session last week.

Farmers about Dixon, Solano County, are making considerable clear side money on sheep.

Raisin growers of Sutter County have decided to joint the California raisin association.

Rice growers of Butte County are being urged to be more careful in regard to quality of seed.

California grape producers are working to secure a law which will take saloons out of local politics.

The acreage of rhubarb has been materially increased in the section about Hayward, Alameda County.

The total shipments of fresh deciduous fruits from California during 1914 aggregated 16,146 cars.

California farmers have opportunity to secure seed of Sudan grass by applying to their congressmen.

Petaluma is to be made branch live stock headquarters for stock which will be exhiibted at the Panama-Pacific Exposition.

Fruit standardization was discussed between legislators and Gravenstein growers of Sonoma County at Sacramento last week.

An expert of the bureau of animal industry, department of agriculture, is investigating hog cholera conditions in Napa County.

The Davis center of the Yolo County farm bureau met at the public library and discussed matters of interest to farmers last week.

University farm experts are reporting feeding experiments with hogs which will give valuable information to hog raisers of the state.

A dried fruit company at Winters, Yolo County, is creating a large business and has secured a special concession at the Panama-Pacific Exposition.

Dairymen of Marin County are working in opposition to the petition of Wells Fargo Express Company for increase in rate on butter and eggs to San Francisco.

It is announced that the cannery at Gridley, Butte County, will be in operation again this year, and better fitted than ever for a great pack of Butte County fruit.

Dairymen at Gridley, Butte County, report the past year to have been the greatest in their history. The Gridley section aggregates close up to 100,000 pounds monthly shipments.

The Solano Farms subdivision project which was helped by funds from the United Railways of San Francisco has received the ruling that no more money should be invested in the project.

Central California

Tulare County shipped practically 3000 carloads of oranges.

Arizona cattle are being received in Fresno County for feeding.

A farmers' institute was recently held at Clovis, Fresno County.

The rains have been favorable to sugar beets planted in the San Joaquin

An olive grover at Terra Bella, Tulare County, reports return from an acre of olives of $1300.

Plans are being made for the formation of a cooperative canning company with headquarters at Tulare.

The Pomona grange of Tulare County recently met at Tulare and installed officers for the coming year.

A representative of the Australian government has been studying irrigation problems in Tulare County.

The orange testing laboratory which has been maintained in Tulare County has been closed for the season.

February 19 has been fixed as the date on which the Western Fruit Jobbers' Association will visit Fresno.

Prof. Bioletti of the state university recently gave a vine pruning demonstration at Reedley, Fresno County.

Committees are busy planning out details of the Raisin Day celebration which as usual will be on April 30.

Dinuba, Tulare County, will exhibit a bunch of bananas of her own growing at the Panama-Pacific Exposition.

A shipment of over $20,000 worth of beef steers was recently made from the ranch of the Porterville Alfalfa Company.

A farmers' institute was held at Orosi last week. Addresses were made by several professors in the state university.

The biennial election of the Alta irrigation district will be held February 3. The district comprises parts of Fresno and Tulare Counties.

Grazing permits will be issued for the Sequoia national forest for the coming season for 30,000 head of cattle, 3000 swine, 11,000 sheep and goats.

The Porterville Poultry and Pet Stock Association is already holding meetings and planning for its next show which will be held in December.

Shipments of raisins from California during December were some 500 tons short of last year same month. The aggregate this year was 3600 tons.

The sixth annual institute held by the farmers of the Kerman district closed last week. There were attendants from all portions of western Fresno County.

Swine raisers of the Dos Palos section hold a meeting this week to discuss practices in hog raising. Addresses will be made by Professor J. I. Thompson, Dr. Tweedy, Dr. Roadhouse and others.

Mrs. Ames of Armona, Kings County, has a native black walnut tree budded to English walnut which has shown a wonderful growth. It was grafted four years ago, and now has a spread of 40 feet. The last season's crop was 125 pounds of nuts.

Southern California

Imperial Valley cotton growers are hoping for a ten-cent price for cotton in the next few months.

Orchardists in the Covina, Los Angeles County, section are appealing for protection from flood waters.

The Azusa Valley water company recently met in annual session. W. R. Powell was elected president.

Most Southern California orange growers are holding back shipments until prices are more satisfactory.

Los Angeles County potato growers are disposing of a large surplus stock since prices have been advancing.

Poultrymen of Southern California met recently in Los Angeles and organized an egg marketing organization.

Azusa, Los Angeles County, is troubled with cattle thieves who gather in valuable young heifers and butcher and sell the meat.

Irwindale, Los Angeles County, has organized a citrus growers' association to affiliate with the California Fruit Growers' Exchange.

President Cuttle of the Tri-Counties Reforestation Committee advocates enactment of a law making a game refuge of the entire Angeles national forest.

A packing house of the Fontana Fruit Exchange, located at Rialto, will cost $30,000 and is promised to be one of the finest fruit packing houses in the state.

At the last annual meeting of the Covina Irrigation Company Manager Elliott terminated his work at the head of the company after 26 years' management.

Entomologists from the state university will investigate more thoroughly than ever the best methods of exterminating the melon aphis of the Imperial Valley.

The Yucaipa Orchard Company held its annual meeting recently. This company has planted 120 acres to apples in the section of Yucaipa, San Bernardino County.

The Orange County Farmers' Mutual Fire Insurance Company recently met in annual session and elected Charles W. McNaught of Santa Ana as secretary and executive officer.

The Industrial Exhibit at the coming National Orange Show at San Bernardino, February 17-24, will be remarkably complete in all implements used in the cultivation of citrus orchards.

Dr. Webber of the Southern California Citrus Experiment Station and his entire force are active in planning for great work to be accomplished on the new site recently selected at Riverside.

At the recent annual meeting of the Tri-Counties Reforestation Committee the following officers were elected: President, Francis Cuttle, Riverside, recording secretary, H. W. Sherwood of Orange County.

In his annual report Francis Cuttle, president of the Tri-Counties Reforestation Committee, states that for 200 days last winter an average of 4448 inches of water from the Santa Ana River was spread over the gravel beds.

The Coast

The Palouse Poultry and Pet Stock Association held its annual show last week.

The spring planting of wheat in Western Washington will be the largest ever.

The wool clip of Montana is reported to be much smaller than that of last year.

Poultry fanciers at Colville, Washington, closed a successful exhibition last Saturday.

The Utah Sheep Shearing Association met in annual session in Salt Lake City last week.

Eastern Washington reports the snowfall as sufficiently heavy to protect fall-sown wheat.

At the present rate of increase the swine industry of Idaho will soon lead all other live stock interests.

Seattle retailers report that as oranges advance in price they are able to demand higher prices for apples.

Farmers' week at the University of Idaho brings out a bigger attendance this year than any preceding year.

Poultrymen at Coeur d'Alene, Idaho, held their show and annual meeting last week. A. O. Laabs is secretary of the association.

The state horticultural association of Idaho recently met at Boise and elected J. H. Lowell president and W. E. Wood secretary.

The Wenatchee-North Central Washington Growers' League has been organized and growers are pledging the marketing of their crops entirely to the league.

The eleventh annual gathering of the Utah state horticultural society at Salt Lake City last week elected officers for the coming year and listened to addresses on horticultural subjects.

The Washington State Wool Growers' Association recently met at North Yakima in annual meeting and elected A. J. Splawn of North Yakima, president, and S. B. Nelson, of Pullman, secretary.

The farmers' union recently met at Spokane and voted to establish a banking institution in that city which should be known as the Farmers' Bank and Trust Company, capitalized at $100,000.

Northwest apple growers are discussing the matter of standardization of fruit boxes and a more liberal advertising campaign which will force a great quantity of its fruit into the hands of consumers.

The annual meeting of the Utah Wool Growers' Association was held in Salt Lake last Monday. The association passed a resolution asking the legislature to place bounties on wild animals which have done very severe damage to cattle interests during the last year.

The new freight rates on live stock from Arizona points to California destinations were established by the interstate commerce committion last week. The rates on beef range from $56 a car for 250 miles to $135 for 1,000 miles. The rates on sheep and goats are approximately one-third lower. Additional charges are allowed not to exceed $2.50 for branch line haul, and $5 a haul over two or more lines.

THRESHING SUDAN GRASS SEED ON W. J. STALCUP FARM, NEAR LUBBOCK

Pure–Dependable–Guaranteed $UDAN GRASS $EED

THERE'S no such thing as saving money on seed. Low-price seed is low-grade seed and every nickel saved in the price will cost you a hundred fold in the harvest. It's the most foolish form of economy — and it's mighty poor farming, because low-grade seed is adulterated and will sow your land with Johnson grass and other pests reducing its value by thousands of dollars.

¶ Lubbock County is recognized as one of the best producing centers of Sudan Grass Seed in the U. S. and the Lubbock Sudan Grass Seed Association is composed of actual seed growers, representing about 95% of the total acreage of the crop in Lubbock County. The chief purpose of the Association is to maintain the absolute purity of the seed crop grown by its members and to supply it direct to farmers.

¶ Every pound of Lubbock Association seed is guaranteed to be strictly free from Johnson Grass and of unquestionable germinating power. During the whole growing season, the Association fields were under constant supervision by inspectors, directed by V. L. Cory, Superintendent of State Agricultural Experimental Station at Lubbock. Only seed from such land as was officially approved and certified to by these inspectors was accepted by the Association as suitable for sale.

WARNING! We are the only authorized agents for selling Lubbock Association Guaranteed Seed Be sure that all seed you buy has our name and trade-mark stamped on every bag.

Ask Your Dealer for Lubbock Sudan Grass Seed Association PURE SEED.

Put up in 1-2-5-10-25-50 and 100-lb. packages. Retail price delivered, $1.00 per lb. Experienced Salesmen Wanted—write for terms.

LARROWE'S Dried Beet Pulp

Puts Silage in the Background

Thousands of dairymen are now feeding this palatable milk producing feed and banking their extra profits. It solves the problem of providing an all-the-year succulent feed for dairy cows.

Order a single sack from your feed dealer and prove its worth by feeding to one cow whose milk record you know.

YOU DON'T NEED A SILO

One ton of Larrowe's Dried Beet Pulp contains as much nutriment as five tons of silage and in addition is clean, healthful and succulent. It is a wonderful milk producer; convenient; economical; always ready at any season. It saves the expense of building a silo, the cost of filling it and the necessity of growing a crop suitable for silage.

LARROWE'S DRIED BEET PULP
Just Like Roots
Makes More Milk

—the ideal feed not only for dairy cows, but also for hogs, goats, sheep, poultry and horses. It is wonderfully rich in carbohydrates; makes a splendid combination with alfalfa. Larrowe's Dried Beet Pulp can be had either plain or with molasses.

Considering the present high price of bran and mill feeds and that Larrowe's Dried Beet Pulp can be substituted for them, pound for pound, and get more milk, now is a good time to commence feeding Larrowe's Dried Beet Pulp. Order from your feed dealer today.

WRITE FOR A FREE COPY OF OUR BOOKLET, "PROFITABLE FEEDING"
It gives valuable information about feeds and feeding and tells how you can get more milk from your cows at no extra cost.

Live Stock and Dairy

GRADE OR PUREBRED IN DAIRYING

THERE are at least four legitimate objects to be held in view when purebred stock is introduced into the flock or herd, says a writer in an eastern exchange. These are briefly: To increase the production, to improve the quality of the product, to secure uniformity in the product, to gratify the eye by pleasing color and symmetry of outline. Many farmers will say that they cannot afford to consider the fourth point, but it should be remembered that many wealthy buyers of pure bred stock are as much influenced by the beauty as by the utility of the breeds or individuals which they select. It is a well known fact also that beauty will add to the selling price of any good animal at the average farm auction sale. If a man is producing beef from a herd of native, mongrel, or low-grade cattle, the introduction of a good purebred bull of pronounced beef type will accomplish all four of these ends. In this case the product is the living animal as it goes to market, and uniformity in size, formation, quality and finish will add materially to the value of a carload of fat cattle. As this condition can be better secured in a herd of purebreds than in any herd of grades, it follows that the purebred has a positive, practical value above the grade for beef purposes, and it is probable that a very large part of our beef, pork and mutton will finally come from purebred herds.

The situation with reference to the dairy herd is, however, entirely different. The products of the various animals are not marketed separately, but are blended into a single article—a can of milk or cream, or a tub of butter, as the case may be. The individuality of the various units of the herd is wholly lost, and the purchaser of the goods has no concern whatever as to the variations in size, form, age or color of the cows producing them. For these reasons we cannot urge the practical dairyman to invest in a registered herd with the same assurance that we feel when presenting the case to a beef raiser. The dairyman can look to an infusion of better blood to increase the milk or butter yield of his herd and within certain limits to improve the quality of either or both. But the dairy cow when past her usefulness in the herd has a rather low beef value at best, and a registered Holstein or Jersey, full of years and honor, is worth no more at the block than her half sister which is a grade. In fact the annual average cash profit per cow will be practically the same from two herds yielding like quantities of milk or butter if one be a registered and the other a grade herd. The difference will lie wholly in the selling value of the calves, and this is a matter of geographical location to a very large extent. Furthermore many dairymen who sell milk are anxious to rid themselves of the calves as soon as possible and do not combine dairying and stockraising very successfully. If these men keep bull calves beyond the age at which they can be sold for veal it is questionable whether they will ever dispose of them at a profit, no matter what their breeding may be.

What then is the sensible policy for the farmer who is largely dependent upon his dairy herd and who owns chiefly native or low-grade cows? My suggestions are not at all radical. He may have some cows which do not yield him a dollar of profit in a season and yet his situation may be like that of my neighbor who justified the purchase of a rather unpromising cow at a local auction by saying: "My contract calls for so many gallons of milk per week this winter and if I can't get it out of good cows I've got to get it out of poor ones:" I do not approve the policy of attempting to do so much on a farm that part of it must be done at a loss and am sure that any man can afford to take time and trouble to weigh the milk of each cow often enough to know which are being kept for nothing. If the Babcock test cannot be readily applied it is quite possible to set samples of the milk of each cow and by comparing the cream yields arrive at some approximately correct conclusions as to the relative desirability of the members of the herd.

When unprofitable cows are located they should be disposed of as soon as they can be brought to marketable condition or as soon as better ones can be found to take their places. But if careful tests show that the herd is composed of a fairly uniform lot of very moderate producers giving only half the net income per cow that modern dairy teachers tell us we should obtain, I would be the last to urge the owner to sell his entire herd and invest the money in registered stock, putting in perhaps eight cows in place of 24 sold and expecting to make three times the profit per cow that was formerly secured. The average small farmer cannot afford the risk involved in making such a change for the death or injury of one cow would then mean the loss of too large a part of his working capital. The only logical course for this man is to secure at once a good registered bull or bull calf of the breed best suited to his needs and raise as many heifers per year as possible, meanwhile losing no opportunity to replace a poor cow with a better one. Not all bulls of the same breed have equal values as sires of dairy cows, but it is an exceptionally poor one which does not earn many times his cost when used in a grade herd.

WHAT IS BABY BEEF?

"What is meant by the term "baby beef" and what kind of cattle are used in baby beef production?" was a question which was put to Professor G. W. Barnes, farm advisor on livestock of the agricultural extension service of the University of Arizona college of agriculture. He answered that fat cattle between the ages of one and two years, weighing between 800 and 1,100 pounds, are used. They must be well bred and of fine quality. Such cattle can be finished quicker and are the only class of cattle which can be used in the production of baby beef. The cattle to be used for this purpose should not be allowed to lose their baby flesh or baby fat. They must be

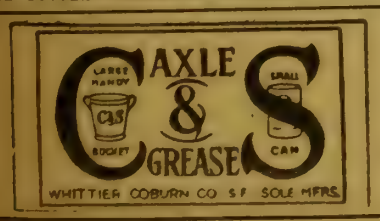
Use any injector, but Cutter's best.

The superiority of Cutter products is due to over 15 years of specializing in vaccines and serums only. Insist on Cutter's. If unobtainable, order direct.
THE CUTTER LABORATORY, Berkeley, California.



A dirty milker is worse than a dirty cook. To wet the hands with the milk when milking is a dirty habit.

kept fleshy from start to finish, for when they once become run down it is a difficult proposition to have them finished for market under 18 months. They must be fed a liberal ration of fat-producing feeds, especially grains. Heavier grain feeding is required for baby beef than for older beef. This is so because calves and yearlings have a tendency to grow rather than to fatten, and it is due to this tendency that we must feed liberal rations of grain to overcome the growing and have the individual put on flesh. When beginning to feed baby beeves they should receive large quantities of alfalfa or cowpea hay or other such rough feeds as will increase their digestive capacity so they can handle large quantities of grain. If heifer calves instead of steers are to be fed they will finish more quickly and should be marketed earlier. The younger the prime heifers are at the time of marketing, the less discrimination in price will the butcher make between heifers and steers. The most common mistake is that of marketing before the individual is ready or ripe.

FAMILIARITY WITH DANGER

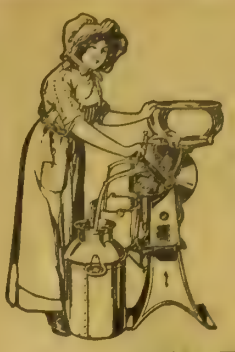
The other day a farmer who has been accustomed to handling dairy cattle all his life was crushed to death by the herd bull on his farm when he went out into the pasture to bring the cows in at night. There is always danger in handling a bull, particularly one of the high strung dairy breeds. Familiarity with danger makes us careless, and every year some men here or there are killed just in this way. No man who is to be successful in handling dairy cattle should be afraid of the herd bull, but should simply be cautious and never give him the chance to get the upper hand. The disposition of a bull is such that if he gets his head against something he wants to push, regardless of what it is he is pushing against, he may destroy his best friend. Most of these tragedies can be avoided.—Orange Judd Farmer.

ADVANCED REGISTRY YEAR BOOK

The secretary of advanced registry of the Holstein-Friesian Cattle Association writes that the 1,070 page blue book containing official records of Holstein-Friesian cows for the year 1914 is now ready for delivery. As there are 6,000 active members of the association and only 5,000 copies of the blue book printed, it is urged that every breeder who wishes to keep the annual year book file complete should order at once. The price is $2. The book may be secured of the secretary at Delavan, Wisconsin.

When pigs are born hairless they are undeveloped, and one may suspect that the sow has been inadequately fed or pampered and given too little exercise. In some instances the cause has been lack of lime in the feed and drinking water, and free use of lime-water in the rations of pregnant sows has ended the trouble. In one district where the drinking water was soft from lack of lime, all the pigs came hairless, and the owner at our advice put lime into the watering tanks and troughs and the trouble subsided. Give pregnant sows plenty of alfalfa hay and roots along with slop of mixed nitrogenous feeds, adding lime-water as advised, or adding a little tankage or bone-meal to the feed.—Farm Journal.

Old ewes, and inferior ones, should be fattened and sold for mutton.



There is no good reason why you should wait till Spring before getting a

DE LAVAL
CREAM SEPARATOR

ON THE CONTRARY YOU may buy a De Laval NOW and save half its cost by May. If, for any reason, you can't conveniently pay cash you can buy a De Laval on such liberal terms that it will actually pay for itself.

AS TO YOUR NEED OF A separator, if you have the milk of even a single cow to cream you are wasting quantity and quality of product every day you go without one. This waste is usually greatest in cold weather and with cows old in lactation, and it counts most, of course, when butter prices are high.

THEN WITH A SEPARATOR there is always the sweet, warm skim-milk and saving of time and labor in addition.

WHEN IT COMES TO A choice of separators De Laval superiority is now universally recognized. Those who "know" buy the De Laval to begin with. Those who don't "know" replace their other separator with a De Laval later—thousands of users do that every year. If you already have some other machine the sooner you exchange it for a De Laval the better.

WHY NOT START 1915 right in dairying? SEE and TRY a DE LAVAL NOW when you have plenty of time to investigate thoroughly. The nearest DE LAVAL agent will be glad to set up a machine for you and give you a free trial.

On Their Feet Again

KOW-KURE

HUNDREDS of farmers and dairymen have felt the joy of seeing sick and ailing cows restored to health and productiveness by the use of KOW-KURE, the great cow medicine. This wonderful remedy has proved its worth for over twenty years in the prevention and treatment of ailments which sap the life and strength of dairy cows—such as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring and Lost Appetite.

Many backward cows are overfed with so-called stock foods when what they really need is a medicine that will tone up the system and repair the sluggish digestive and genital organs. HEALTHY cows will thrive on nature's food and produce more and better milk.

If you have a cow that is below par, go to your druggist or feed dealer and try a package of KOW-KURE; the result will surprise you. *Sold in 50c and $1.00 packages.*

WOOL COUNTS

When you read the London wool reports you frequently see wool referred to as 46s, 50s, 64s and so forth, in fact all foreign wool literature is couched in these terms. The United States is the only country that grades wool as ½, ⅜, ¼ blood, etc. In place of such terms the foreigner uses figures to indicate the fineness of the wool. The finer the wool the higher the number that is given it. These numbers are supposed to indicate the number of yards per pound that a certain quality of wool will spin. Yarn is bought and sold by the pound according to the fineness of the thread. Yarn number 1 is the coarsest and is supposed to contain a thread 560 yards long to each pound. Yarn number 2 is not so coarse and contains twice 560 yards of thread to each pound or 1,120 yards. Yarn number 60 would contain 60 times 560 yards of thread to each pound. And so on, each yarn number representing the number of times 560 yards that it contains.

Now it is from these yarn numbers that wool gets its number. A wool that will spin a yarn of 50s fineness is designated a 50s wool. Of course the fineness and strength of fiber determines the number of the yarn that a certain wool will produce. Wool is not always spun into as fine a yarn as it might be but long experience has enabled the wool handler to tell from a piece of wool just about how fine a yarn it would produce. It is possible, however, to convert our somewhat cumbersome wool terms into the more accurate terms used in foreign market. Oour braid wools would in London, be numbered as from 30s to 38s. Our quarter bloods from 40s to 49s; our three-eighth bloods from 50s to 56s; our one-half bloods from 58s to 60s; our Merinos from 60s on up, depending on their fineness. Now of course all the numbers between 40s and 49s are not used or between any of the designations here given but our wool would fall in the classes here given. Our fine Territory Merinos would average about 64s and that is about the average of the Merino wool grown in other parts of the world including Australia. We produce a considerable amount of wool that grades as high as 70s and a small amount that runs as high as 80s. Australia produces a large amount that runs from 70s to 80s and a small amount that grades up even to 100s. There is not much demand for wool, however, finer than 90s. The price of these scoured wools depends on their fineness. Let us look at the Boston market. Today a Sydney 80s is quoted in Boston top price at 67 cents per scoured pound, a 70s at 63 cents; a 64s at 59 cents; a 60s at 54 cents.

As we have before explained, a wool that will spin into 64s yarn is designated a 64s wool no matter how much of it may be required to make the pound of yarn. It is interesting to learn how long a thread a certain fine wool will produce. Take a 70s yarn, this means that such a yarn contains a thread seventy times 560 yards long or 39,200 yards, equal to 22¼ miles. How much grease wool would it take to make this pound of yarn? The amount varies somewhat depending on the shrinkage but probably three and one-half pounds would be sufficient. Then each pound of grease wool would spin into a thread about seven miles long. If we estimate the average fineness of all American wool to be about 60s and that we produce 132,000,000 pounds of scoured wool then this would spin into a thread 2,142,000,000 miles long or sufficient to circle the earth 85,680 times.—National Wool Grower.

LOCOED

In the veterinary department last week, under the title "Faulty Eyesight," Dr. Petrie prescribed for a horse which pulls back on entering the stable and shows pain when pressure is exerted on the back of head or top of neck. The horse had been on desert pasture. Subscribers have written, suggesting that in their opinion this is a case of loco. We have seen horses affected in this way, and they surely had symptoms similar to those described by the Inyo-Kern writer. We give the communications, for they have suggestions from men who have had much California experience. Dr. Petrie will comment in his department next week.

T. F. Kerr, Lakeside

Dr. Petrie is probably not familiar with the effect of "loco" weed or "rattle weed" poison on horses. These horses had undoubtedly been eating either "loco" or "rattle weed." They should be kept where they cannot get it, and fed a good grain ration. If allowed to run where they can find the poisonous weeds they will soon be past all cure and entirely useless. The "rattle weed" destroys much more quickly, but horses are not so likely to eat it as they are the "loco," which works more slowly and is less deadly. The bad effects will gradually disappear if they are kept away from the weed.

J. F. Williamson, Coalinga

It isn't eyesight that ails these horses; they have got rattle weed and are in bad shape. They will finally go blind and die unless kept off the range where they can get it. It is a light-blue colored plant that grows in the desert parts of California, has pods like a pea vine and a light yellow blossom in the spring. If the Inyo-Kern subscriber will ask any oldtimer in his neighborhood they can tell him what ails his horses.

Ira H. Howard, Germantown

These horses have undoubtedly had access to pasture containing some variety of loco or rattle weed within the last six months, or it is in the hay. If you will write to these parties you will find that in addition to the symptoms given, partial blindness, etc., there is more or less constipation, drooling of saliva, white of the eye is pink, and the hearing is very acute, so that the animal will start and tremble at any sudden sound. They will also hold the head in a peculiar, slanting position when standing still. This disease is quite common in some parts of the country. Have seen at least three kinds of rattle weed. In general, it is well to be suspicious of any weed in the pasture that has a pod like a pea. It usually takes several months from the time it is first eaten till it affects the actions of the animal. Cattle are also affected sometimes, but as their nervous system is not so highly developed, they are affected in a lesser degree.

Stock usually avoid the large perennial loco weed, but the smaller varieties are mixed with the grass, so that it is hard to avoid it. The veterinarians here give a powder in the feed, an arsenic preparation I think. A mild physic or laxative in the feed is necessary. Good bright alfalfa hay is good for them, and green grass is still better. In the cases given, if they have only been affected a short time and are properly taken care of, they should be almost as good as ever in a few months, but may never quite recover. This information would have been worth a good many dollars to me last year, as I killed two horses that seemed to be worthless that might have been saved.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Hair Ball

A neighbor lost a heifer only a few months old. He found a ball two and one-half inches in diameter, composed mostly of hair, in her stomach. Did this cause her death and if so what can he do to prevent others being affected the same way?—Subscriber, Visalia.

Hair balls are caused by cattle licking themselves and swallowing the hair. It accumulates in a mass and forms a very hard ball. There is no way to prevent it and it occurs so seldom that the owner is not likely to ever see another case of it. Hair balls do little or no harm

unless large enough to obstruct the passage of other food. Usually they pass out before becoming large enough to do any harm.

Pawing a Habit

What causes a horse to paw and stamp a great deal with the front feet when he shows no nervousness otherwise? I have looked for lice but find none.—Subscriber, Victorville.

Pawing usually indicates pain or some irritation of the feet or the skin just above the feet, but as you describe it I should judge that it is due to a habit. Take a chain about a foot long, put a strap through the end link and buckle the strap around the ankle of the foot that he uses most when pawing. He will inflict his own punishment and soon forget the habit.

Dry Murrain

What is the disease that is called dry murrain?—Subscriber, Visalia.

The term dry murrain has been applied to diseases of cattle that cause inflammation of one or more of the compartments of the stomach. The inflammation stops digestion. The food dries and will not pass. It might be caused by poison or any irritating or astringent substance and is only a symptom of the result of some disease. The term is not used now in scientific journals.

A Cicatrix

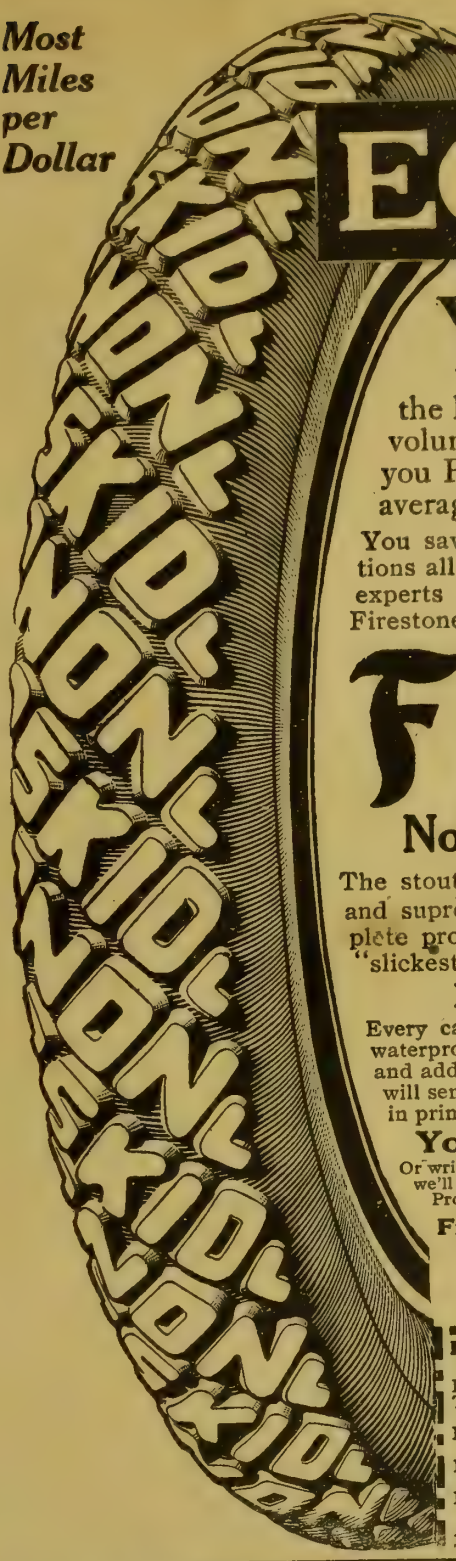
About three months ago in breaking a horse it fell and snagged itself on the inside of its hock. The wound has been a long time healing and it is leaving quite a large callus place. What is the best to reduce the callus and cause the hair to grow?—Subscriber, Arroyo Grande.

Have your druggist prepare the following ointment: Tincture of iodine one ounce, iodine crystals one dram, lard oil two ounces and vaseline two ounces. Mix and apply once a day. Rub in well.

Quittor

Three years ago my horse had a gravel pass through the hind foot, coming out just below the fetlock. He was laid up about two months during which time I used warm water with a little carbolic acid in it and could inject it through the passage of the gravel. He recovered from his lameness but a year after it commenced to suppurate again and act as it did at first. The swelling around the top of the foot did not entirely disappear. I treated him as before with like results but recently it has started again worse than before. I have had two veterinarians treat him with no results. They prescribed an injection of peroxide of hydrogen followed by a lysol solution, one tablespoon to the quart of water. He got some better but now there is a constant flow of matter with some lameness and swelling.—Subscriber, Vacaville.

Probably a false membrane has formed around the pus cavity and that will have to be gotten rid of first. Get this from your druggist. Chloride of zinc one dram and water eight ounces. Mix. Wash out the cavity with warm water, fill it with the solution and plug up both ends with some cotton soaked in the solution. After four or five days wash it out again with warm water with a little soap in it. Keep the outside clean and do not put anything through the opening unless pus appears. If the canal goes straight through it will heal easily but if there are branches that run off to the side it may need to be cut open to find just where to put the medicine to reach the ends of all the branches. A good blister around the top of the foot would also help some.



ECONOMY

YOU save first in getting extra value without paying extra price. Because Firestone Tire builders are specialists—picked experts who work in the largest exclusive tire factory in America. Immense volume of output keeps down production-cost, and gives you Firestone quality at the price you would pay for the average grade tire.

You save money in service results with Firestones. Road conditions all over the country are thoroughly understood by Firestone experts and your road troubles are reduced to the minimum by Firestone dependability and endurance.

Firestone

Non-Skid and Smooth Tread Tires

The stout, thick letters of the Non-Skid tread give extra strength and supremely long wear. Angled and gripping, they afford complete protection against skid or spin. You can tackle the heaviest, "slickest" roads with Firestone Non-Skid Tires.

Free Firestone Offer

Every car owner will appreciate this fine rubberized, waterproof Tube Bag. Send us your dealer's name and address and the make of tires you use and we will send one Free. Will keep your Inner Tubes in prime condition.

Your Dealer Has Firestones

Or write us and we will see that you are supplied. Anyway we'll be glad to send the Tube Bag and Free Book on the Proper Care of Tires. Ask for Book No. 36

GILBERT HESS, Doctor of Veterinary Science, Doctor of Medicine.

How Can You Expect Fertile Hatching Eggs If You Don't Condition Your Poultry Now?

On the condition of your poultry right now depends the fertility of your hatching eggs and the health of your spring hatches. Start in at once to condition your flock. Get your hens in a healthy, thrifty condition, see that their dormant egg organs are toned up and kept active. If ever the poultry raiser is in need of eggs, it is surely right now. Under the most liberal guarantee ever put in print (read below) I want you to try

Dr. Hess Poultry PAN-A-CE-A

Not a Stimulant, But a Tonic

In this scientific poultry preparation I have put every ingredient that my 26 years' experience as a veterinary scientist, doctor of medicine and successful poultry raiser tells me that poultry need to keep them well and make hens lay.

My Pan-a-ce-a will put stamina into your flock, will prevent cholera; it is also a splendid constitutional treatment for roup and is a sure cure for gapes, leg weakness, indigestion and the like. But, above all things else, I guarantee that it will make hens lay eggs. Now, here is my guarantee—read every word:

So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy, make your hens lay, and help your chicks grow that I have told my dealer in your town to supply you with enough for your flock, and if it doesn't do as I say, return the empty packages and get your money back.

Sold only by reliable dealers whom you know—never peddled. West of Rockies: 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. $1.00; 25-lb. pail $3.00.

Send for my free book that tells all about Dr. Hess Poultry Pan-a-ce-a.

DR. HESS & CLARK - Ashland, Ohio

Dr. Hess Stock Tonic A fine tonic for hardening and conditioning stock for spring work. They need this after the long siege of dry feed all winter. Makes stock healthy—expels worms—guaranteed. West of Rockies: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion.

Dr. Hess Instant Louse Killer Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or keep it in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c; 3 lbs. 60c. I guarantee it.

Poultry for Profit

THE BEST GREEN FEED

Written for California Cultivator by Jean A. Koethen

THE value of green feed for poultry does not seem to be wholly understood even by experts. We are told that it is necessary "chiefly for its hygienic or physiological effect and not for the amount of nutriment which may be supplied therefrom," yet who questions that some nutriment, varying according to the amount of protein and carbohydrates contained in each, is to be derived from even the lightest and most watery of greens? "Back East," where the hens get little green feed besides sprouted oats during the winter months, the natural laying season is said to date from the time when grass appears on the hillsides, and many a hen no doubt does her best laying with weeds for the succulent portion of her ration.

I like to put it in this way to myself: The hen's body, like her egg and like the human body, contains a very large per cent of water, about two-thirds, it is generally stated. Professor Jaffa says every dozen eggs contain about a pint of water. Even an unlimited supply of the purest drinking water is insufficient for the needs of both body and egg, for the hen, great drinker that she is, will hardly drink all that is necessary for all purposes. Green feed furnishes the additional water needed and in a more palatable shape and contains, beside certain mineral salts which help to keep the system in order, and more or less protain, ash and carbohydrates. The heavy layer is necessarily a heavy eater, and she requires an extra amount of water for flushing the system. Of course, hens will lay for a time with little or no green feed, but it seems inevitable that liver trouble or an overfat condition of the abdominal organs should ultimately end their productivity. What fruit and green vegetables are to the human family greens of some sort are to the hen. We who have acquired the California appetite for fruit and know the craving which comes in early spring when fresh fruit is scarce can easily realize the feeling of the hen when she is asked to lay eggs on a diet of dry grain. And if it is hard to do without green, how much harder must it be for hens to live confined within sight of green which they are not allowed to touch. Keeping hens under such conditions seems to be perilously near criminal cruelty. I presume some hens require more green than others, and all require more in hot weather than in cold and more in a warm, dry climate than in a cold, wet one, but all need more or less at all times, and a supply must be provided.

The values of the different greens may be placed in a sliding scale with alfalfa and clover at the top and beets and pie melons at the bottom, though it must be always remembered that green is green, and that the value of these greens lies more in their greenness than in the protein and ash which they contain. Professor Jaffa (Bulletin 164) gives these figures for the water and protein content of the more common greens:

	Water. Per Cent.	Crude Protein. Per Cent.
Alfalfa	80	4.94
Sugar beet leaves	88.75	1.91
Cabbage	90.50	2.40
Lettuce	94.70	1.20
Red clover	70.80	4.40
Pie melons	94.50	.77
Thousand-headed kale	85.15	2.63
Oats (sprouted 5 days)	51.46	4.77
Barley (sprouted 5 days	54.66	5.92

The sprouted oats and barley make up for their lack of water by a much higher content of carbohydrates, that of barley being 32.93 per cent, while that of oats is 32.58, which means that these sprouted grains are more valuable for the other nourishment they supply than as green feed. Professor Jaffa is careful to state that sprouting adds nothing in the way of nutriment to these grains, but he does not say, what is perhaps too obvious to need saying, that the greater palatability which results from sprouting is almost as good as additional nutriment, because the hens will eat twice as much of the sprouted grain as they will of the same thing dry.

Professor Dryden (Oregon Agricultural College Bulletin 157), in giving the number of pounds of the different feeds a hen requires in a year, makes 20 pounds of kale the equivalent of 15 pounds of alfalfa, vetch or clover. This, he says, is on account of the greater amount of water in kale, but he recommends as "probably the most profitable crop to grow for winter forage" in Western Oregon and the Pacific Coast generally, thousand-headed kale, an acre of which "may be made to produce 40 tons of green forage." For winter green food, "kale is transplanted in July from seed sown in May or June. For summer forage it is planted early in the season. It is possible in Western Oregon to have green kale the year round. For a flock of 100 hens about 200 plants will furnish green food enough for a year where the soil has plenty of fertility and moisture. The plants should average 20 pounds each. The chickens will eat about half the weight of the plant, the balance being stalk which they do not use. Cattle will eat most of the stalk. Planted in July the kale may be fed from October to April. Planted early in the spring from seed sown in the fall, it will be ready for use in the summer. In the early part of the season the lower leaves may be stripped off and the rest of the plant will continue to grow. The plants are set about three feet apart each way. A very small piece of ground, therefore, will grow enough kale for 100 hens. A strip of good land 16 feet wide and 100 feet long should furnish enough green food in the form of kale for 100 hens. At that rate an acre of kale will furnish green food for 2500 hens throughout the year. Kale may also be utilized for shade for fowls. Where they are yarded, by having double yards it is possible where kale grows the year round to make it furnish both green and shade all the year. It will also keep the yards in sanitary condition, turning manure and filth into revenue."

What Professor Dryden says of the possibilities of kale in Western Ore-

gon is even more true of California. I have had kale planted early in the spring of one year last till the same time the following spring, and I do not know how much longer it would have lasted if I had not pulled it up. Of course the leaves grow tough and strong in time, and mine, when I pulled it up, was not only tough and strong, but "buggy." The hens seemed to like the bugs though so there was no loss.

Kale is well adapted to a locality where water must be economized. Once it gets a good start—and it should be planted very early in order to utilize the winter rains—it will grow through the summer with very little water. I have been told that it will manage very well with no water at all, but this I have not tried. I have never tried transplanting kale as early as January but I am going to try it this year. If the rains come as they are likely to come I see no reason why kale should not grow as well as rape and barley.

The worst thing that can be said against kale is that the hens are not very fond of it and will not eat it if they can get anything they like better. Perhaps this is not really an objection for hens like children can be taught to eat anything that is good for them. On the desk before me as I write is a picture of one of the houses at the Oregon station. On one side hangs a thousand-headed kale plant which reaches nearly from the roof to the ground, and a lot of hens are pecking at this as if they enjoyed it. If hens will do this in Oregon I don't doubt they will do it in California.

For rapid winter growth and easy raising there is nothing like rape. It is especially adapted for use in empty pens where a crop must be quickly grown. I planted several pens two weeks ago with rape mixed with barley, and the leaves are already peeping through. My only reason for using barley was that I wanted as heavy a crop as possible in order to purify the ground, and rape does not seem to grow as closely as barley and oats. I think that where hens are kept on the double-yard system a crop of rape sufficient to purify the ground could be grown in three months and it would furnish forage for the hens for some time. Rape is sown broadcast like the grains. I spade up the pen, sow the rape and rake it over and let the rain do the rest.

Professor James E. Rice of Cornell recommends for yards where the stock can be turned in a combination of oats, peas, red clover and rape. "The oats and peas," he says, "furnish a rapid growth of green food a good deal of which will be tramped down, and some will go to seed, but it will serve to protect the clover and rape which will make good food for late summer and fall pasturage. Three pecks of oats, two pecks of peas, one pint of rape seed and five quarts of red clover will be a good proportion for seeding."

For yards into which fowls must soon be turned there is nothing better than oats and barley. They grow rapidly, give excellent green feed while young and tender and furnish shade and good picking for the baby chicks after they are grown. Many poultrymen plant these grains just for green feed and then cut the young, tender blades in the clover cutter.

Another green which I have found very satisfactory for spring use is mustard. When it grows wild in the neighborhood I go out and gather it by the armful for my hens and I don't cook it, as did one amateur poultryman I heard of. The hens are nearly as fond of it as they are of lettuce, and I am sure it stimulates egg production. Last year I planted some and this year shall plant more. The fact that the hens are ravenous for it is sufficient proof to me that it is good for them.

The mangel beet is another green I am trying this year for the first time—that is to say, I have planted some in spare corners. The root is very valuable food, having a nutritive ratio of 1:5, and is very highly recommended for winter use. How much value there is in the tops I shall not know till I have tried them. Other years I have found the half-sugar beet tops excellent, but they require more water than rape and kale, and water is so expensive in our section that I must keep up a constant search for things that will do well with little.

Sprouted grains are excellent feed and a fair substitue for other greens when the others are not to be had, but they do not take the place of the succulent leaves of the green forage plants unless the birds can run at large on them and nibble all day. Then they become one of the best. This, however, is not what we mean by sprouted grains. In the fall when green food was scarce I sprouted oats and barley in a box covered with a wet burlap sack placed in the sun. Now that the rains have come, and the soil of the runs is damp, I bury the grain, dry, in the ground, and after four or five days turn it up with the spade. By planting a little in each yard every day I keep the hens supplied with something to dig for, and how they do crowd round when they see the tiny, succulent, white sprouts! I think they like the grain better when it is sprouted in this way than when they get it in a block from the boxes, and I get quite a little fun digging it up for them. For a large number of hens this method would be impossible, but for a back yard flock it is a very good way. For one thing it keeps the hens interested, and this I suspect is more important than some of us have guessed. For another it keeps the soil of the pens soft and clean. For a third it coaxes the hens to eat a good deal of oats and barley and saves something on the wheat bill.

Green feeds differ a little in their effect on the egg itself. "Clover, alfalfa, grass, rape, kale and vetch," Professor Dryden says, "will give good color to the yolk of the egg; beets will not. Alfalfa and clover will give eggs good quality and flavor. Kale, cabbages and rape will give a slightly undesirable flavor to the eggs if fed heavily, but not enough to injure their selling value materially, if at all. If fed regularly, however, so the fowls may eat at will, there is no evidence that an undesirable flavor will be imparted to the egg."

Lettuce and chard I have not mentioned because, while they are two of the very best green feeds, I doubt if conditions in California warrant their use to any great extent. Both require a great deal of water, and I have found it cheaper to buy chicken lettuce at ten cents a sack from my Japanese vegetable boy than to try to raise it myself. It is worth while to raise a little for young chicks, but for hens kale, vetch, rape, mustard, beet tops and the various grains are cheaper. We are coming rapidly, I hope, to the time when every one who raises poultry in confinement will have some sort

40 Acre Equipped Farms

On every 40 acres we install a pumping plant, provide trees and seed adapted to the soil, and necessary farm implements to begin your work.

This establishes you at once on good land in the early fruit district of the upper Sacramento Valley, and assures crop returns the first year. Every one who wants a farm should investigate this offer. Write to.

MUST HATCH INCUBATOR COMPANY (Inc.)
418 Seventh St., Petaluma, Cal.

When writing advertisers, mention the Cultivator.

of double-yard system so that the hens may be moved back and forth while quick growing greens like rape, kale and the various grains are grown in the empty pens. Such a system is especially adapted to this climate and gives the best results in every way. It is said that in the Australian egg-laying contests, where some remarkable records were made, credit was given largely to the grass range on which all the hens were kept. Grass range is not possible here but there are other things that may take its place.

FEDERATED POULTRYMEN

For nearly a year the Cooperative Association, through its officers, has tried to educate the poultrymen of Southern California to realize that the method of marketing eggs has been suicidal. There were times when the price of ranch eggs was 13 cents higher in San Francisco than in Los Angeles on the same day.

Such a condition of affairs brought forcibly to the attention of the poultry growers that something was really radically wrong. After calling two meetings last fall, when nothing definite was agreed on, a committee of three went to Petaluma to study methods of marketing at that point. More than ever it was apparent that the plans first proposed were the only feasible ones.

Steps were at once taken to agitate the matter once more. At a general meeting it was agreed that the chairman should appoint a representative poultryman from as many different districts as possible to act as temporary committee on ways and means. These men met from time to time, and through their efforts an option on 200,000 hens was secured, after which a meeting of all the signers was called at Los Angeles for the purpose of perfecting the organization and also to elect five trustees to manage the affairs of the organization, to be known as the Federated Poultrymen of Southern California. The following have been elected trustees: J. M. Davison, Arlington; M. A. Schofield, Gardena; Cornele G. Ross, Pomona; B. R. Holloway, Van Nuys; Frank B. Smith, Santa Anita; chairman and president of the federation, M. A. Schofield; secretary, Frank B. Smith.

These trustees are authorized to sell the combined product to the best advantage, involving now the eggs laid by 250,000 hens, which sale, it is hoped will be consummated the present week.—M. A. Schofield.

FARMERS GREAT CHURCH BUILDERS

The American farmer is the greatest church builder the world has ever known, according to an article recently given out by Peter Radford, lecturer of the National Farmers' Union.

"The farmer is the custodian of the nation's morality," says the article; "upon his shoulders rests the ark of the covenant and he is more responsive to religious influences than any other class of citizenship."

It is pointed out that the farmers of the United States have built 120,000 churches at a cost of $750,000,000, and the annual contribution of the nation toward all church institutions approximates $200,000,000 per annum. An average of 23 churches per day is the record of the American farmer in building churches. There are 20,000,000 rural church communicants and 54 per cent of the total membership of all churches reside in the country.

Mr. Radford further states that "the farm is the power-house of all progress and the birthplace of all that is noble. The Garden of Eden was in the country and the man who would get close to God must first get close to nature."

WANTED

Wanted—2 more berry growers to come to SANTA CRUZ, CAL., to grow berry plants for us under contract for 5 years; will also buy all the fresh berries when we put up our new berry drier in 1916. We will guarantee that you will double your money each year. We need 1,000,000 berry plants grown each season, and also use 100 tons of berries for our drier. Send for particulars to SANTA CRUZ BULB & PLANT CO., 3 NEW ST., SANTA CRUZ, CAL.

Wanted—Practical man that understands desert land culture, well boring and general farming, one to take charge and handle large acreage and accept nominal wages and percentage of crops for his labors. Must be practical worker and come recommended. Apply to H. M. L., Room 612, No. 110 Sutter street, San Francisco, Cal.

Wanted—A reliable party to put out large acreage to Burbank Cactus on half shares. For information write to John Zuur, Santa Rosa, Cal.

Wanted—Contract for grafting walnut trees. Am in a position to handle all orders promptly in a satisfactory manner. Oliver C. Geyer, 214 S. Almansor street, Alhambra, Cal.

Wanted—About 50,000 sweet potato plants for April delivery. Quote best prices and give references. Lancaster Feed & Fuel Co., Lancaster, Cal.

Position Wanted—As foreman of ranch by practical farmer, experienced general ranching and bookkeeping; reference. Box C, Cultivator Office.

Wanted—To hear from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

JELLY FROM CITRUS FRUIT

(Continued from Page 101)

checks evaporation which would result in the formation of crystals at the surface.

Summary of Process

Palatable orange jelly has been made as follows: 1: Slice thin or crush oranges. 2: Place in pot with enough water to prevent burning. 3: Heat slowly to boiling and boil till soft. (45 to 60 minutes). 4: Press through heavy cloths. 5: Let stand 24 to 36 hours. 6: Draw off or decant clear liquid; filter sediment through heavy cloth. 7: Add clear juice of two lemons to jelly stock from one dozen oranges. 8: Add sugar and dissolve by warming. Adjust to 58 to 62 Balling or 32 to 34 Baume. One and one-half volumes sugar to one volume of stock gives this result approximately. 9: Heat to boiling, boil three to four minutes and skim. 10: Pour into glasses and cover with melted paraffin.

Lemon Jelly—1: Slice or crush. 2: Press out juice. 3: To pulp and peels after pressing add just enough water to cover. Proceed from this point as with oranges.

Yields—Yields in laboratory tests when calculated to yields per ton basis were 150 to 300 gallons jelly per ton or 2000 to 4000 small glasses per ton.

Bitterness—Oranges at the beginning of the season give a slightly bitter jelly; thoroughly ripe fruit does not give a bitter flavor.

Flavor—A great deal of the orange flavor is lost during boiling; orange oil or extract can be used to advantage by adding it to the jelly ofter it has cooled to 150 degrees Fahrenh... or lower.

season, and especially ... should be so treated ... sunburn of grapes aro... of the vines, which ... greatest hindrance ... crops by the ... said his ... was th... new ... es...

vation, as often as 16 or 17 times through the season, and also on pruning as late as possible in the spring just before the new growth starts on the vines, and thought it of great importance to have heavy irrigation in the fall just after the first heavy frost in order that the vines may have plenty of moisture during the period they are dormant, with which to prepare for a strong new growth in the spring, and gave illustrations from practical experience.

Cut Out Old Wood

All old wood should be cut out as far as possible and new wood brought up from the stump of the vine every year, according to his ideas, to an extent very different from the ideas of most vineyardists at present. With Thompson Seedless, for instance, he is positive that by pinching back the tips of the new canes at a point just below where the last fruit bud comes out they could be increased in their crops to a normal average of four tons per acre instead of the one ton or less which is now quite common. To pinch off buds in this way he estimated might cost $6.00 per acre, but that was immaterial for the crop could be doubled or quadrupled. This pinching process must be carried on within about 14 days before the vines bloom and could be kept up at intervals later in the season, and if well done would, on Muscats particularly, produce a very large crop so quickly following the first crop that they could all be picked at one time and all be larger grapes and make better raisins than by our present methods.

As to sulphuring vines, he was very strong in his belief that far more sulphur should be used than most growers are now using, that 30 sacks per 100 acres was little enough, and that sulphuring should be done at least evry 10 or 12 days, starting before the buds come out in the spring and continuing six or eight times during the season. He gave effective illustrations from various vineyards named of the profit of a great amount of sulphuring as compared with its stingy use, and for this reason favored the old gunnysack method of spreading sulphur rather than the use of the modern sulphuring machine which encourages the operator to the use of little sulphur in order to save refilling often.

Destroy Mildew Wood

He was as radical about cutting off all mildew wood as he was about sulphuring for the prevention of mildew and stated cases where he had cut off all the new wood of Muscat vines early in the summer when they were badly affected and had started out a complete new growth with great ad... for both the cur... ting mildew

ESTABLISHED REX 1896

For Citrus Spraying

REX LIME and SULPHUR SOLUTION

Minimizes Scale Troubles, Controls Red Spider, Destroys Fungous Growth, Tones and Vitalizes the Trees.

For Deciduous Spraying

REX LIME and SULPHUR SOLUTION

Kills the Insects, Destroys the Eggs, Deadens the Fungus Spores, Is a Tonic, Fertilizer and Vitalizer for the Trees. Is the best general clean-up Spray there is. Most efficient and used in larger volume for Peach Leaf Curl and Twig Borers year after year.

For Vineyards

REX LIME and SULPHUR SOLUTION

Sprayed on vineyards during dormant season, destroys the fungus spores and equals any spray in controlling mildew.

The Rex Companies Specialize Spray Materials and our chemists devote their entire time to this work. Eighteen years of continuous Spray business means that Rex Sprays have the virtue. They are the standard.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Trees Near Line

Would like to ask the legal department regarding eucalyptus trees near line. What steps must I take to have them removed? Can I claim part of the wood? I have no use of land for at least 20 feet from the trees.—Subscriber, Hynes.

If the trees are on the line they may be removed by consent of both parties only. If entirely on the land of the neighbor then one is helpless to have them removed unless they may be declared a nuisance, which it would be difficult to do. The owner of adjoining property is within his rights when he cuts a trench along by his line, stopping the feeding of the roots on his land. If, however, these trees have damaged the land, as indicated, to the extent of 20 feet and the owner can show definitely a certain cash loss, this can possibly be recovered. We do not know that this has ever been tried, however. This query is not referred to the legal department for the reason that similar ones have been answered many times practically as above.

Garlic

Would like instruction as to culture of garlic?—Subscriber, Days Creek, Ore.

Would refer our subscriber to the issue of the Cultivator of February 26, 1914, containing cultural directions by Mr. Murdock.

Grafting Muscats

Is it advisable to graft two-year-old Muscat vines into Thompson Seedless?—N. D. E., Del Rey.

Whether or not it is advisable to graft two-year-old Muscat vines into Thompson Seedless will depend on the circumstances. If your grape vines are very vigorous and if there is a complete stand and if you have only a few vines to graft and an expert man to do the work it may be advisable to do so, but on the other hand if you have in your county the phylloxera which may infest your vineyard at any time, I certainly would not waste any money on grafting the Muscat vines. If the variety is unsuitable to your locality and if your grape vines are only two years old it certainly would be more convenient to plant either Sultanina grafted on a resistant stock or the Sultanina on its own roots. We must not lose sight of the fact that no matter how experienced a man may be along the line of this work, not every grafted vine is going to make a complete union in the first place and secondly not every grape vine will grow, hence we have to either regraft or in certain cases dig out the vine and replant. If the vineyard was mine I certainly would not hesitate for one moment to dig out the Muscat vines and plant Thompson Seedless, either bench grafts or Thompson Seedless on their own roots.—F.

[illegible] in Dinuba

[illegible] should one plant potatoes in [illegible]tion?—Subscriber, Dinuba.

Your neighbors and your nearest weather bureau station can answer this better than can one at a distance. Potatoes are planted in California from December until the next December, depending upon the locality. As a rule, the early spring crop is planted in late January and through February and early March but there are sections where it would be of little use to plant potatoes any earlier than one would in some eastern and northern states. On warm sandy loam where there is good drainage it would probably be safe to plant potatoes in the Dinuba section any time during the next month or surely in March.

Lime-Sulphur Solution

I wish to spray peach and apricot orchard with Rex solution but do not know how to mix it. What proportion of lime, sulphur and salt should one use? Can I mix it strong and dilute? —Subscriber, Selma.

The term "Rex" solution is used to apply to a commercial wash put up by a large concern in this state and it is complete with the addition of water and without the addition of any lime, sulphur, or salt. Doubtless the container in which it is sold gives proportions in which it may be used but we imagine for dormant trees it is about one gallon of the solution to ten gallons of water. The lime, sulphur and salt solution may be mixed at home if desired but in modern practice salt is seldom added as the lime sulphur solution is usually considered adequate. As to information regarding the mixing of this wash would refer to the special spray number of the Cultivator which was issued September 11, 1913.

Dressing for Wounds

I have just pruned my olive trees, having cut off the tops quite severely, and consequently have left quite a large surface of fresh open wood on some cuts. Should these be treated in any way to cover the wound?—Subscriber, Oakland.

Where a wound is large it is best to cover with an antiseptic or a paint of some kind in order to prevent moisture from aiding the entrance of fungus spores. Some paint the cut surface with bluestone or with Bordeaux but the result is not permanent unless followed with an application of grafting wax, tar, or similar substance. A good lead and oil paint, if the oil is not permitted to come in contact with the bark of the tree, is entirely satisfactory. The wax and shellacs are somewhat inclined to pull off and crack. Common coal tar is perhaps one of the best but this, like the oil in the paint, must not be allowed to come in contact with the bark. Perhaps the most common of all, so far as general use is concerned, is the ordinary grafting wax consisting of two pounds resin, two pounds beeswax, one-fourth pound tallow, with a little linseed oil.

Eucalyptus Leaves for Mulch

Can the leaves and litter from a eucalyptus gum be profitably used as a fertilizer or mulch for an orange grove? If the latter, how and when best applied? If the former, how best decomposed and applied?—Subscriber, San Diego.

There is no reason why these leaves

should not be applied directly to the soil, either left on the surface as a mulch or plowed under, assuming they are to be used in an orchard. The newer horticulture seems to demand for California soils the incorporation of anything in them which will loosen up and allow the water to get into the lower depths. Some go so far as to plow under the smaller orchard brush, old boots, tin cans, or anything of a similar nature. We would certainly not miss the opportunity to plow under eucalyptus leaves or similar material.

Walnut Trees Not Bearing

I have two large walnut trees in my yard which give me but few nuts. What kind of fertilizer should I use to induce them to bear?—Subscriber, Rialto.

It is difficult to say with any degree of certainty what may be the reason these walnut trees do not bear. There are trees which never have even a moderate crop, whatever may be done for them, so it is possible the trees you have may be of that kind. If the trees are growing well and have had large leaves I would advise putting on about 15 to 20 pounds of 17 per cent superphosphate to the tree. This should be spread all over the ground for 25 feet in each direction from the trunk and plowed under. Then if the growth is very bushy I would prune out until I was sure the sunlight would get through so as to show patches of sunshine on the ground when the tree is in full leaf. This pruning can be done any time before the buds open. Do not be alarmed if sap should run from the cuts as there is plenty more water in the ground, or should be at any rate.—J. B. Neff.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Renewal of Mortgage

Does a mortgage have to be renewed and how often?—Subscriber, Bachelor.

The renewal of mortgage is only for the protection of the mortgagor, as after it is due suit for foreclosure can be filed at any time. It should be renewed each time it becomes due.

Division of Ranch

A and B own a ranch undivided; A afterwards got a pasture range cornering on the undivided ranch and wants B to divide and give A the undivided half next the pasture range, which is more valuable with the pasture range, as the one-half is more valuable for farming and alfalfa, but B wants the same one-half as A. How is best to divide when both want same?

If you cannot arrange to amicably divide the pasture, an action may be taken to have the court divide or sell the same.

Employer's Liability

I hired a man to help me pick oranges. While at work on the first tree a limb swung back in such a way as to injure his eyeball so that he was obliged to quit work and return home where he has been confined under the doctor's care. Am I responsible and to what extent?—Subscriber, Orange.

Redemption After Foreclosure

A, B, C and D each own an undivided one-fourth interest in 160 acres of land on which is a mortgage. Party holding mortgage forecloses and land is sold to A. Can B redeem all of the 160 acres within one year or can he redeem only his undivided one-fourth interest?—Subscriber, Lemon Cove.

Assuming that the above mentioned parties were co-tenants the purchase under mortgage foreclosure by A was, notwithstanding any design he might have to the contrary, for the common benefit of all of the co-tenants. The title acquired by him is held in trust for the others if they choose within a reasonable time to claim the benefit of the purchase by contributing or offering to contribute their proportion of the purchase money. B, if he should redeem, would stand in the same shoes as A. In other words, any of the parties by offering their proportion of the amount paid by A can be restored to their former possession. In order to foreclose their rights A would be required to bring action against them to foreclose the lien which he has secured on their interest by the purchase of the foreclosure sale, and anyone of the co-tenants could by action against A and upon payment of their proportion procure a judgment restoring them to their title.

Suit to Collect

A man refuses to pay his bill and dealer brings suit. The wife homesteads the property to protect herself and in consideration of the dealer dropping the suit against her husband she signs a note which the husband does not sign. Can the dealer collect without the husband's signature? Can he take her home after it is homesteaded?—Subscriber, Riverside.

The dealer can bring action against the wife and get a judgment upon the note as the consideration for dropping the suit is sufficient to hold her. Under execution in such action he cannot sell the homestead.

Sale of Estate

A father, at his death, deeded his home to his three daughters, all of age. Two wish to sell; the third wishes to remain in the old home and does not wish to sell. She is not able to buy the two-thirds interest belonging to the others. Can she be forced to sell her interest?—Subscriber.

The third daughter cannot be forced to sell, but the other two may bring action for a partition and have the property either divided or sold, in which event each would be given one-third.

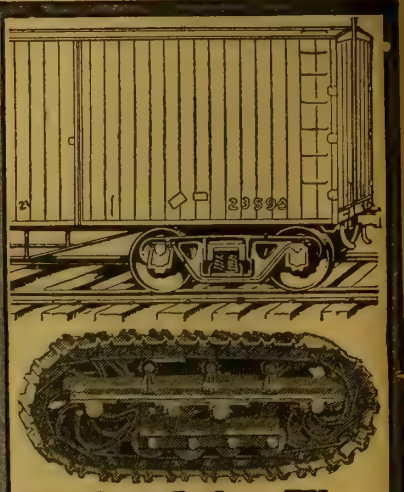
KEEP EVERYTHING WORKING

It has been recognized by business men that everything must be kept at work if an enterprise is to prosper. Loafers will kill any business in the long run. The business of farming is no exception. Unfortunately, definite rules are not as easily worked out for farm operations as for many other kinds of work, but as knowledge accumulates it becomes easier and easier to establish general principles of this kind. One farmer called attention to the fact that about the first of September a great many of the hens in a poultry plant either cease laying or do not lay enough eggs to pay for their feed. He advises immediate sale unless there is some especial reason for keeping them for the remainder of the season, for so far as these hens are concerned failure to sell will result in loss. Dairymen recognize that unless a cow produces during the season more than enough salable product to pay for her keep, which includes interest on the investment, she should be disposed of. Any animal which ceases to be profitable ought to be sold immediately, unless for some sentimental reason or other it is to be retained. This failure to keep everything working is a terrible handicap for agriculture. It will never be possible, of course, to determine just what animals are profitable until comparatively accurate records are kept. The up-to-date farmer is doing this and he must do it more and more. A field which does not produce enough grain to pay the interest on the investment, the cost of production and then some, must be so treated that it will show this profit. All these things require thought and study. It makes it necessary for the farmer himself to do less manual labor and work harder with his brain. In the long run, it will be found that brain work is much more profitable than manual labor. It will also be found that it is more wearing, but the combination of the two works very nicely.—Orange Judd Farmer.

IMPROVING CEREALS BY SELECTION

The experimental farm at Guelph, Ontario, Canada, in some respects at least, may be regarded as a model of what such an institution should be. Of particular interest and most prolific of solid information to the visiting farmer are the trial beds of the various cereal crops. Professor Zavitz, who conducts these trials, is more than an investigator. He has also brought out practical results in the improvement of cereals by selection that are quite remarkable and point the way for other propagators to follow. The province of Ontario produces a great deal of barley, perhaps more pounds of it than of oats, and the cultivation of that cereal is still increasing. The barley grown is mostly of two varieties; one introduced from Russia 23 years ago, all started from one pound of selected seed. The other variety was started from a single plant selected at the station grounds by Professor Zavitz ten years ago, and is now called O. A. C. (Ontario Agricultural College) No. 21. It is a six-rowed variety, weighing 50 or 51 pounds to the measured bushel, and yields more heavily than the older varieties. This barley has been distributed from the station to farmers in pound lots, and is now, after so short a time, the leading sort grown in the province, increasing the aggregate barley crop of the province to a considerable extent.

Ontario also produces about $40,000,000 worth of oats, and this is the crop of which more bushels are grown than of any other grain crop. One of the drawbacks of the oat-growing business is the large number of varieties grown, as this results in an uncertain and varying product, so that buyers are never sure of what they get. Buyers do not get enough of any one kind, and there is danger of the growers losing their market. The station has now started another variety from a single plant selected among many thousands as the best. It is a Siberian oat, now called O. A. C. No. 72, and has already been distributed among 300 farmers in pound lots. It is thought probable that in three or four years this variety will take the place of all other varieties grown in Ontario. All this is very interesting. What has been done and is being done in Ontario can be done in other places, and by other investigators and propagators, not only in cereals, but also in other lines. The field of opportunities for improvement is wide open and exceedingly promising.



Rides Like The Car Wheels On Steel Rails

That's the plan of construction in the "Creeping Grip" tractor. It lays and carries its steel track. It rides smoothly, creeping over the soil with a firm grip. It loses no power in slippage—it never packs the soil—saves money in fuel bills because of the greater power delivered—at the draw bar. Here's the tractor that cuts the cost of plowing and gets crops in on time. The

"Creeping Grip" Tractor

can enter soft fields in early spring when other tractors must lie idle waiting for wet spots to dry. By comparison the creepers are lighter on the soil than an empty wagon. They climb and oscillate over obstructions, carrying the machine on a center axle. Two points of contact rest on the ground, thus avoiding jolts on the machine. The frame rides on 3 points of suspension, which eliminates binding on bearings—upkeep cost is reduced to a minimum.

The Household Department

WHAT OF THAT?

Tired? Well, what of that?
Didst fancy life was spent on beds of ease?
Fluttering the rose leaves scattered by the breeze?
Come, rouse thee; work while it is called the day!
Coward, arise! Go forth upon thy way!

Lonely? And what of that?
Some must be lonely; 'tis not given to all
To feel a heart responsive rise and fall;
To blend another life into its own.
Work may be done in loneliness; work on!

Dark? Well, and what of that?
Didst fondly dream the sun would never set?
Didst fear to lose thy way? Take courage. Yet
Learn thou to walk by faith, and not by sight.
Thy steps will guided be, and guided right.

Hard? Well, what of that?
Didst fancy life one summer holiday?
With lessons none to learn, and all of play?
Go, get thee to thy task! Conquer or die!
It must be learned; learn it, then, patiently.—Selected.

THE BOUILLON TEST

THERE were three of them—Laurentine, who was beautiful and talented, Barbara, who was talented and beautiful, and Peggy, who was nothing but a girl. The description was Peggy's; whenever the others heard it, they always fell upon her, both literally and figuratively.

"You know you're the best-loved girl in the village, Peggy," Laurie would say; and Barbara would add, "Peggy's a fraud. She knows that the youngest is always Fortune's favorite. She's really expecting the fairy prince any moment."

That was when Peggy was eighteen and Laurie twenty-one. Before Peggy was nineteen, things had happened—so many things all at once that the girls were dazed by them. The first was the appearance of the fairy prince. He was a very modest fairy prince, and it would be several years before he could carry off the princess, because a young doctor—he had come as assistant to their father, Doctor Armstrong—has to make his way slowly. Moreover, he came not to Peggy, but to Laurie. Young Doctor Dana was a fine, frank fellow, much in love with his profession, as well as with the doctor's daughter.

"You'll be doing it next," Peggy said to Barbara one night.

"I'm not that kind," Barbara scoffed. "I want to study biology. Just the little bit I can do in father's little laboratory makes me wild. It's you who'd better be careful."

"Gracious, no! Why, there are some things I want to do myself."

"You'll never get time to do them—not in this town, where all the old ladies and children think you belong to them."

Peggy sat up, with her hands about her knees and a very earnest look in the eyes under her tumbled red-brown hair.

"You know, Barbara," she said, with unwonted seriousness, "that's exactly one of the things that's bothering me. You know that father thinks every girl ought to be able to support herself. You and Laurie could do it—Laurie with her music, and you—father said only last week that you could teach physiology as well as any medical professor; but I—I can't do anything except the home things, and odds and ends that anyone can do. It's—very—discouraging."

There was actually a little break in Peggy's voice.

Probably neither of them would have remembered the conversation if it had not been for the things that happened that spring. A few weeks after their talk came the first great sorrow of their lives. In April, Doctor Armstrong was called out at midnight in a heavy storm. He had not been feeling well for some time. He came in at breakfast time utterly exhausted. Before night he was in a heavy fever. People drove over the wintry hills to inquire for him with tear-choked voices. Dana, as devoted as a son, had hardly twelve hours' sleep in four days. But neither love nor skill could avail, and at the end of the four days the doctor died. He had given himself for his pepole until he had no more to give.

The Armstrongs bore their sorrow with the same gallant spirit that the doctor had shown in his life. The family settled down to the new existence with a brave memory in their hearts. They had a little to live upon; they had their own garden and fruit, and they made their own clothes.

Then, suddenly came the second blow. Squire Jeffries seemed singularly embarrassed when Peggy opened the door for him. He asked for her mother, and soon was having a long talk with her in the library. Then the old squire went down the path, switching the bare bushes with his stick—a sure sign that he was troubled and displeased about something.

Mrs. Armstrong called the girls together, and told them. It was the $1,000 mortgage that Doctor Armstrong had put upon the house during the hard winter three years before, when there was so much suffering everywhere. He could not press his bills in such a season, and because he could not let his people die for want of food and fuel, he had given money out of his own pocket. The mortgage was held by Sam Custin, the rich manufacturer of Pierpont; he had taken a fancy to the old white house and lovely garden, and he refused to extend the mortgage; it would fall due in six months. And Squire Jeffries had gone off in a towering temper because Mrs. Armstrong would not let him pay the mortgage outright, and had only gruffly consented, after long argument, to take the mortgage, with the time extended, himself.

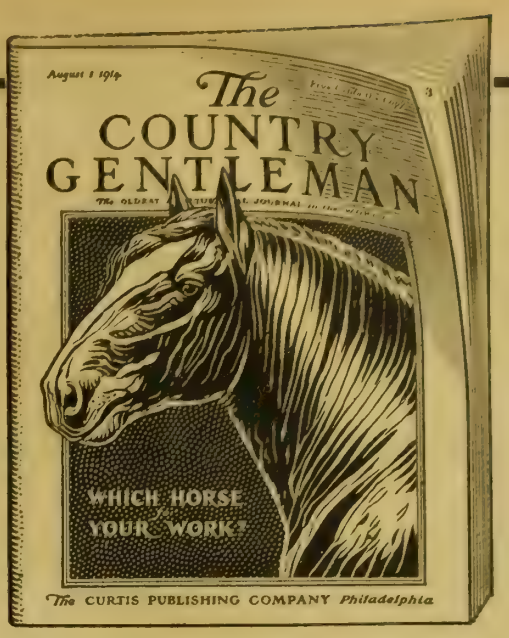
"But we mustn't ask Mr. Jeffries for another extension," said Barbara. "He really isn't rich."

"What shall we do—use the Y. P. S. money?" Laurie asked.

Dries things quicker

Welcome Clothes Dryer attaches to any stove pipe—right where things get all the heat. Ten detachable arms can be taken down out of the way when not in use. Equals 20-ft. line. No strings to break, or nails to tear clothes. "You deserve thanks of womankind," says a mother. Price $1.00. If your dealer cannot supply you we will send Dryer postpaid on receipt of price. Money back if not satisfied. Circular.

E. J. Chubbuck Co., Dept. A, 731 Market St., San Francisco, Cal.



25¢ for THREE MONTHS

To put the big $1.50 national farm weekly at once into half a million farm homes, the next 13 issues of THE COUNTRY GENTLEMAN will be mailed to your address for 25 cents—less than two cents a copy!

60% of The Apple Crop Never Reaches Market. Are YOU Wasting Half of YOUR Fruit?

Bad selling methods and poor quality are the causes of this enormous waste. The 1914 apple crop was the largest ever produced, 259,000,000 bushels, and less than 40 per cent. of the crop will be sold. Yet thousands of consumers would like to get good apples. That is why quality and packing are paramount questions discussed in every issue of our journal.

The Biggest Poultry Profits Are Made In Three Ways.

(1) Breeding high layers, (2) Hatching baby chicks, and (3) Fattening dual-purpose breeds. We sent the most expert poultryman we could find on a long trip through the great poultry states to visit practical plants and discover how the profit-paying plants are run. He got the facts. His observations and advice will appear in a number of special articles.

Do you know when the market is best for your class of stock? To the dairyman, hog raiser, horseman, feeder and breeder there is no more important question. It will be thoroughly discussed by a competent man and illustrated by charts. It may save you $100—possibly more. The war made some feeds cheap. Are you using them?

The COUNTRY GENTLEMAN

Five Cents the Copy, of all Newsdealers. $1.50 the Year, by Mail

Ask Us Your Hard Questions.

Our expert advisers will answer any question you send us. They will plan your orchard, suggest varieties, cover crops, fertilizers, spraying mixtures, methods of cultivation, tell you how to harvest, select, pack, ship, store and sell profitably. All inquiries will be answered promptly *by mail.*

You will also be helped by the scores of articles on general farming, gardening, beekeeping, livestock, poultry, etc., by making immediate use of this coupon.

When writing advertisers, mention The Cultivator.

"But they are twenty-year bonds," Barbara reminded her. "We can only use the interest. Of course, we might sell them, but it might take time or be at a loss."

"And eggs—or—gingerbread! It wouldn't be possible to earn $1,000 in such a short time," Peggy said.

"But I don't see any other way," Laurie said, slowly.

"Any other way than what?" Barbara asked.

"Than to accept Squire Jeffries offer. Of course we'd transfer the mortgage to him, and pay it back as fast as we could. If one of us could get a position!"

"Yes, or if one of us could come into a fortune!" said Barbara, with tears in her eyes. "Positions are so easy to get on a minute's notice!"

Yet, they all agreed, that was the best thing to try. Barbara could write to a teachers' agency, and Laurie could try for a position as companion. As for Peggy, there was nothing for her to be except her mother's assistant and Jack-of-all-trades. And that consciousness made Peggy slip away to her old childish hiding place in the attic, bury her red-brown head upon her arms, and cry. She felt as if the old house were a part of their very lives that could not be torn from them without leaving a vital wound. It had been her father's home, and his father's before him; and it only needed $1,000—

Peggy sat up suddenly. People owed her father hundreds of dollars—she knew that they did. Surely they would want to pay—for his sake. She would look up his account books.

She flew down to the office. It was quiet there. Peggy took down the big ledger, and began studying it breathlessly. There were the Nelsons; why, the Nelsons alone owed $97—and that at the very lowest rates. That was nearly a tenth of the whole mortgage. And the Andersons—father had been going regularly to old Mr. Anderson for seven years; and there were the Craigs and Mrs. Bennet. Peggy worked on and on; $400—$500— Her brown eyes were shining now, and her tumbled hair was more tumbled than ever. She leaned over and joyously patted her father's old medicine case.

And then a strange thing happened. Suddenly she seemed to see her father's face; and in his steady gray eyes there was a look of sorrow. She looked at the sheet of figures before her, and all sorts of memories thrust themselves upon her. The Nelsons—yes, undoubtedly they owed that money, but how could they pay except by selling their two cows, and then what would the children do? And old Mr. Anderson—she remembered how he sat, shrunken and shriveled, the last time she saw him. And the Craigs, and Mrs. Bennet, and the Lucketts.

"Oh!" she cried, with a little sob. "O father, I didn't understand—I didn't understand!"

And she tore the sheet of paper to little bits. Laurie's advertisement brought no answer at all, and the teachers' agency told Barbara that it was hard for anyone without experience to get a position. Peggy was raising chickens, and Barbara made gingerbread, and Laurie planned to put up preserves and jellies but at the most they could not expect to earn more than $100. A hundred—possibly—out of $1,000, and two months gone!

Then came a letter that threw them all into excitement. It was from Mrs. Norman, an old schoolmate of their mother, who had opened a tea room in Boston the year before, and who now was to open one for the summer at a seashore resort. She needed a manager, to whom she would pay, if she could find the right one, $800 a year. The work was not hard, but it required tact and taste. Remembering her old friend's skill, and knowing that so many girls were eager to earn their own living, she wondered whether one of Mrs. Armstrong's daughters would not consider the place. If so, Mrs. Norman would run up for a day and talk the matter over. The girls looked at one another. If they could—if only one of them could! A year and a half—two years at most—would pay the mortgage and all the extras, and make the home theirs forever.

"I ought to be the one—I am the oldest," Laurie declared.

"But—to leave Dana!" Peggy objected.

"And I'm stronger than you are, anyway," Barbara argued, "and besides, though you can make jellies, nobody can beat my gingerbread."

Peggy sighed. It would be of no use at all for her to think of it. Then her happy common sense came to her rescue as usual. They would all be helping to save the home, no matter which one actually earned the money. She flung herself whole-heartedly into the future.

"Let's plan Mrs. Norman such a luncheon!" she cried. "And oh, if it's pleasant, let's have it out on the porch! It's so lovely looking down into the garden, now that the June pinks and the larkspur are in bloom."

So they began to plan. There should be consomme and fried chicken, and Peggy's little biscuits, preserves and salad, and Barbara's gingerbread and whipped cream, and fresh strawberries, and coffee in the New Orleans fashion, with the cup half full of pecans.

"It may be new to her so," Peggy suggested, "and if she doesn't like it, she can have coffee any way she does like it, afterward."

A week of beautiful weather made the strawberries delicious, the garden was at its loveliest, and even the first roses bloomed in time for the luncheon. There was to be a bowl of rosebuds in the center of the table and a half-opened rose at each plate. As she arranged the table, Peggy broke into little snatches of song; she loved to make things pretty! Laurie's soft color was heightened by the excitement, but Barbara's lips were tense. Barbara was taking it hard. Yet when Mrs. Norman met the group at the steps, she thought that it would be hard indeed to choose among the girls, each charming in her way.

Ten minutes after Mrs. Norman's arrival, while they were all talking on the piazza, the gate opened, and three elderly ladies appeared. Barbara gave a gasp, and murmured something that sounded to Mrs. Norman like "Angels defend us!" The next instant the new arrivals were being greeted and introduced with the utmost simplicity; Laurie took their wraps, and Barbara and Peggy ran into the house for chairs. In the dining room, however, the three girls looked at one another in consternation.

"Of all days in our lives to have cousins twice removed drop in!" Barbara groaned.

"We'll have to set another table," Laurie said. "It is fortunate we hadn't begun. We can bring the little round one from the front room. We —girls, there isn't consomme enough to go round!"

Peggy's eyes began to dance. "We can fix it," she declared. "We three will have the little table anyway." In a whisper she told them how she would solve the problem, and then ran to the kitchen, bubbling with laughter.

The extra table was arranged quickly and quietly. The girls did not guess how keenly Mrs. Norman had watched them, and they were too much absorbed in their tasks to notice the pleased look in her eyes. Twenty minutes later Peggy, white-aproned, with a rosebud tucked into her rebellious hair, was serving the consomme. There seemed to be enough to "go round," but once Mrs. Norman heard a chuckle at the small table, and glancing quickly up, saw Barbara blush suddenly, and observed that Peggy's eyes were full of laughter. Mrs. Norman again smiled to herself.

The luncheon was delicious. The guest of honor noticed many things. She saw that, although the strawberries were served in the French fashion, on the stem, there was another dish of them, hulled, for the old cousins, and that there was tea, as well as coffee and pecans; each guest's preference had been remembered. After the luncheon, they all sat and talked upon the piazza. But time was passing—and it was evident that the cousins had come to spend the afternoon. Mrs. Norman presently turned to the girls.

"Won't you show me your garden?" she asked. "It looks so beautiful out there."

The girls agreed eagerly. They wandered up and down, gathering flowers for their guest, talking of a score of things, thinking only of one, until finally Mrs. Norman turned toward a shady bench.

"Can't we sit here and talk business a few minutes? I hate to leave all this, but my car goes at ten minutes past four, you know. My dears, you have put me into such an embarrassing place! I want you all! But tell me—who made those delicious little biscuits?"

"Peggy," her sisters replied together.

"And the delicious salad?"

"Laurie."

"And the gingerbread?"

"Barbara."

"But that's my only specialty," Barbara added, honestly.

Mrs. Norman laughed softly. "It is just as I foresaw—there's no choosing among you. Who arranged the menu?"

"All of us. And Peggy did the flowers, and Laurie embroidered the lunch cloth, and Barbara thought of the porch arrangement."

Mrs. Norman leaned forward with dancing eyes.

"And who," she asked, "forgive me, but who thought of using tea in place of bouillon?"

There was a second of astonished silence; then laughter and questions.

"How did you guess? We didn't suppose anyone could possibly—it was so exactly the same color. Oh, we didn't make a mistake and give you—" Laurie broke off in consternation.

"You didn't make any mistake; my bouillon was bouillon, but I happened to see Barbara absent-mindedly put sugar in hers, and then your faces told me the rest. It was a clever substitute. Whose thought was it?"

"Peggy's," Barbara replied. "Peggy always can think of a way of making things go round."

"Then," Mrs. Norman answered, smiling, "if you can spare her, I think I shall take Peggy. But if for any reason she would rather not come, I shall count myself fortunate to have either of you who will."

"O girls!" cried Peggy. I didn't suppose that I could ever help—really."

That night, too much excited to sleep, Peggy lay thinking over the wonderful afternoon. It would be hard to be away from everyone for a year and a half, but to remove the debt from the dear old home—father's home! A lump came into her throat at the thought of that. She would gladly have worked ten years for the home. And all the time Barbara could be working and saving for the study she so longed for, and in a year and a half Peggy would be back home, forever and ever!

Outside the window the elm branches brushed the roof lightly in the night breeze that whispered softly through the leaves. In the darkness Peggy's happy eyes filled with tears.—Youths' Companion.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Halves of Oranges
Broiled Beef Patties
Apple Fritters Sugar Syrup
Buttered Toast Coffee

Lunch or Supper

Scalloped Codfish and Rice
Fried Egg Plant
Zante Muffins Warm Apple Sauce
Tea or Milk

Dinner

Scotch Broth
Veal Loaf Browned Potatoes
Creamed Spinach
Lettuce and Grapefruit Salad
Chocolate Farina Pudding, Cream
Coffee

Scalloped Codfish and Rice

Blanch one-fourth cup rice by covering with two cups cold water; put over the fire, stirring occasionally while heating to prevent its sticking; boil five minutes, drain on a sieve and rinse with cold water. Return to the fire in a double boiler, add one and one-fourth cups milk and one cup salt codfish, previously soaked over night. Cook until the rice is nearly done and the milk absorbed. Put in a baking dish, cover with one-half cup medium white sauce. Sprinkle with buttered crumbs, place in the oven and bake about 20 minutes or until well heated through and browned on top.

Chocolate Farina Custard

Heat one pint milk in a double boiler; when hot, sprinkle in four teaspoons farina. Cook slowly at least 15 minutes. Add two ounces grated chocolate to the yolks of three eggs beaten with four tablespoons sugar and then add slowly the hot milk; return to fire, cook a few minutes, then cut and fold in the stiffly beaten whites of the eggs. Cook two or three minutes longer to cook the egg, add one teaspoon flavoring, pour into wet moulds and set away to cool. Serve with cream.

Zante Muffins

Cream one-fourth cup butter and one-half cup sugar; add two eggs well beaten; mix well, then add three-

(Continued on Page 127

Four rounded tablespoonfuls Ghirardelli's Ground Chocolate; two cupfuls sugar; one cupful milk; butter the size of a small hen's egg; one teaspoonful vanilla; two drops lemon extract. Boil sugar, butter and milk until thick and add chocolate; cook until thread spins when tried; then add extract and take from fire, stirring until nearly cold or becomes sugary. Turn on a well buttered dish and cut in squares.

Ghirardelli's Chocolate Fudge

This recipe makes the best fudge you ever ate—This is but one of the dainty goodies that can be made with

Ghirardelli's Ground Chocolate

Ghirardelli's Ground Chocolate is as old as the West. Its purity, strength and healthfulness is retained in hermetically sealed tins.

Ghirardelli's Ground Chocolate makes a beverage that is beyond compare. There is nothing so good—nothing so economical.

Order from your grocer to-day.

HAY

Under date of January 23, Scott Magner & Miller say:

Receipts of hay for the past week were 3371 tons. This is a large increase over the previous week, 2477 tons. Although it is early to predict crops for the coming season, the weather has been most favorable for a large crop. Demand for alfalfa has been light and receipts heavier than usual. Straw is unchanged.

We quote the average wholesale prices on carloads lots of hay on today's market, as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and	

Oat .... 9.00@10.50

Citrus Fruit Market

LOS ANGELES, January 27, 1915.

The auctions show fairly good returns on best fruit. Above $2.60 has been given as average on a few small lots. The price generally, however, will run close to the $2.00 mark. Of course other markets are better than the auctions.

The lemon market is looking more hopeful.

Shipments

Shipments of oranges to date from Southern California since November 1, 1914, 3163 cars; lemons, 722; total, 3888. Last year same date, oranges, 3578; lemons, 351; total, 3929. From Tulare County this season, oranges, 5035; lemons, 120; total, 5155. From Northern counties, oranges, 533.

NEW YORK, Jan. 25.—Fifteen cars navels, one mixed car and one car lemons sold. Market unchanged on navels and lemons. Raining.

IDEAS FOR THE COOK

(Continued from Page 125)

fourths cup milk. Mix and sift together one cup cornmeal, one-half cup flour, one-half teaspoon salt and two and a half teaspoons baking powder. Add to the first mixture with one-half cup currants, mix thoroughly and pour into hot buttered muffin pans. Bake about 25 minutes.

Broiled Beef Patties

Grind one pound round steak two or three times, shape into patties about two inches in diameter and one-half inch thick. Place in a smoking-hot frying pan and broil about five minutes, browning first one side, then the other. Sprinkle with salt and pepper, spread with butter and serve.

Enough kerosene on the drinking water to form a thin film over the surface will help to avoid spreading roup through the flock, when the disease is contracted by one or two individuals. If the disease appears, a good roup remedy should be resorted to at once. Isolate the affected individuals and treat the whole flock. Prevention is much easier than to cure.

In saving birds for breeding, look out for good vigor along with breed type. The bird with a tendency to crow-headedness and long toe nails, which denote inactivity, should be avoided as a pestilence.

Potassium permanganate and several of the commercial roup cures combine chemically with tin or iron. The result is that when they are given in the drinking water, they eat holes in the pans and fail to do the birds any good. Where the water clears or changes color soon after putting the medicine in, when a tin or galvanized pail is used, the trouble can generally be avoided by using a crock.

A HANDSOME ONE

The new Germain tree and seed catalog is the niftiest ever yet gotten out by the Germain Company. It has 100 pages, with attractive cover showing an orange tree ready for planting. Incidentally, there is an inset of Germain's giant comet aster which certainly is a beauty. The catalog is illustrated and has an instructive text regarding the planting of everything in the garden. It covers ornamentals, vegetables, and nearly everything in the tree line. It may be had by addressing the Germain Seed Company, 326 South Main Street, Los Angeles.

Our Paint and Stains are the same make you are paying $2.00 a gallon for. We sell Paint in every town on the Coast at wholesale. Save money — don't pay the high retail dealer's profits. STEADY AND QUIET ECONOMICAL OF FUEL

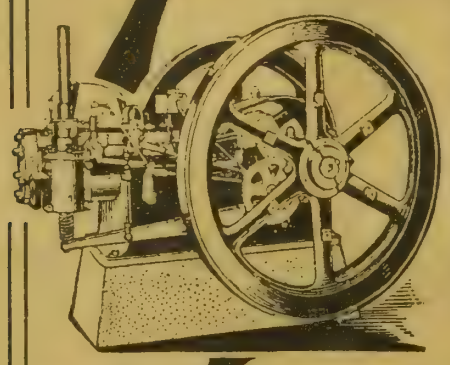
Western Gas Engines consuming special gas oil at 2⅝c per gallon, cost one third of a cent per HP. per hour to operate.



All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

Before you buy an engine send for our catalogue—free to all who write for a copy.

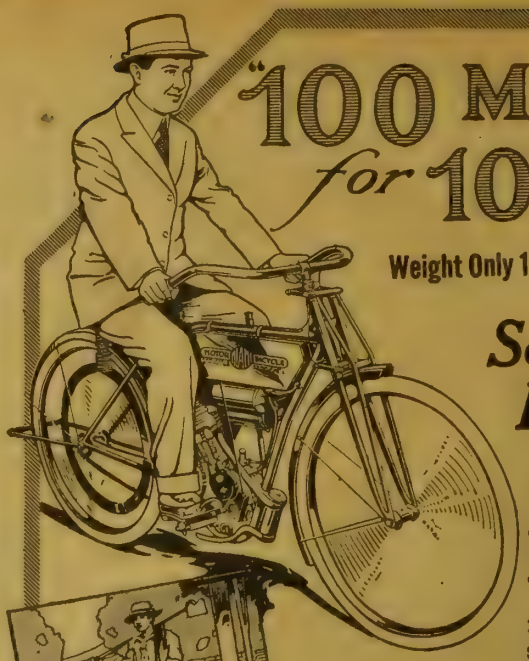
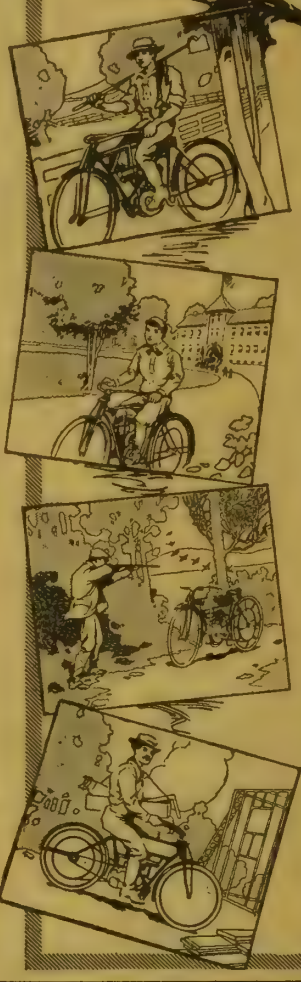
"100 MILES for 10 cents"



Weight Only 110 Lbs. Price Only $125

Something Entirely New!

IT'S not a motorcycle, and it's not a bicycle, but a real *Motor Bicycle*—something that every one of you can enjoy, and afford to own and maintain. It is the lightest, simplest and easiest-handled motor vehicle *in the world.* It places motor travel within the reach of thousands *for the first time.* It appeals alike to all classes—professional and business men, clerks, mechanics, salesmen, farmers, students, boys and girls.



The Miami Motor Bicycle
SAFE - SILENT - CLEAN

You can use it for a quick run to town and back; a trip over into the next county; a run out into the open, or to and from work every day. It is so light you can go anywhere that a heavier vehicle can—and it costs only ten cents a hundred miles.

It is safe for anyone old enough to ride a bicycle because it is so light and easily managed—and it is far superior to a bicycle for business or pleasure. It will take you from 4 up to 25 miles an hour—and the motor does all the work.

Write at once for free Booklet

telling all about the Miami Motor Bicycle, how simple in construction and easy to take care of. You can buy one from your cycle Dealer or direct from us.

Little Stories of Success

No. 2

The real record of records goes to Hansen Bros., of Rio Vista, Cal. We quote their letter verbatim:

"The 75-horsepower, 30-inch track Caterpillar No. 2108 we purchased from you May 15th, 1914, ran 45 days in harvest, pulling a 26-foot cut Holt Harvester that we had used 40 horses on, previous to purchasing the Caterpillar.

"We harvested over hills that had from 10 per cent to 48 per cent grades. The Caterpillar works up or down hill or around the hill just as well on account of the two-speed gears.

"In spite of the terrific strain when working on the hillsides, the track never gave us any trouble—no wear on the truck wheels and they never once left the track. The tracks never slipped, even on the steepest grades.

"We averaged over 40 acres per day using 45 gallons distillate and one gallon oil per day.

"Our engine is in A No. 1 condition and ready to go ahead with the fall plowing without a cent of repairs."

Ten years have brought the Caterpillar to the point where it will stand a whole lot of hard knocks without going to pieces.

My $10 model home orchard now for $5

f.o.b. Ontario.

It consists of 29 varieties of fruit, no two alike. The greatest little nursery bargain ever offered you, and the assortment will supply you with fresh fruit for family use from May to December. Send $5.00 and receive this model orchard by return express.

John S. Armstrong
Proprietor
404 Euclid Ave. ONTARIO, CAL.

SEED TIME

"Cheap" seeds are dear at any price. But why pay high pr for the best? We are not in the L. A. Seed Combine, but we have b selling seeds right here for years, giving the best of satisfaction beca we sell the VERY BEST. We pay as much for our seeds as they do theirs, which our invoices will prove. Our slogan: SEEDS at LC PRICE and NO PRICE can buy better. Send for our Price List.

Foundation Stones for Success

Dean Hunt of the State Agricultural College Asks Heads of Departments for Short, Concise Statements of Their Ideas of Principles That Will Lead to Success

RECENTLY Dean Thomas Forsyth Hunt of the college of agriculture of the University of California asked the specialists in charge of various departments of the agricultural work of the university this question: "What are the fundamental principles of successful agriculture?"

In response each man "boiled down" into a single page the facts he regards as basically important for the particular agricultural pursuits in which he is a specialist.

ANIMAL HUSBANDRY

By Gordon H. True, Professor of Animal Husbandry

Farm animals convert raw materials grown on the farm into valuable finished products. The improvement of farm live stock is dependent on the use of pure bred sires. Good breeding and individuality should be combined. Mature breeding stock gives best results. Too early breeding results in under-developed stock. Where possible proven sires should be used. A mother in good condition at parturition raises her offspring best. Over-feeding often results in impairment of breeding functions. Inbreeding is dangerous. Different breeds of livestock are adapted to different natural conditions. Form in animals indicates function. It is a mistake to attempt to combine diverse uses in the same animal. The cheapest growth is made by young animals. Young animals should be kept growing from birth to maturity. Exercise is important for young stock and pregnant females. In feeding young animals their ultimate use should be kept in mind. Regularity in care and feeding make for best results. Animal comfort promotes profit. Ruminants are especially adapted to the economical use of rough feed. The growing pig should be fed at least two per cent its weight of grain daily. Sheep keep down weeds on the farm. Sheep are well adapted to rough grazing lands. A production of at least 250 pounds of butter fat or 6000 pounds of milk per cow per year should be the aim in dairy farming.

DAIRYING

By Leon M. Davis, Assistant Professor of Dairy Industry

The care given the raw materials in creamery production determines the quality of the finished product. Cleanliness and low temperatures are controlling factors in producing good dairy products. Poor dairy methods and poor dairy products are coincident. Workmanship and methods used in manufacturing dairy products influence quality and yield. Sterilization of the utensils used in handling milk or cream tends to reduce contamination. Sanitary buildings and equipment tend to reduce contamination. Factors which tend to check bacterial development in milk and cream favor their keeping quality. Pasteurization reduces the bacterial content of milk and cream. Immediate cooling of milk or cream removes the animal heat and checks fermentation. Sacrifice of quality for yield tends to reduce the demand for manufactured dairy products. The successful handling of dairy products requires cooperation from producer to consumer.

CITRUS FRUITS

By J. Eliot Coit, Professor of Citriculture

The most important factors in successful citriculture are: The soil, favorable climatic conditions, irrigation, fertilization, cultivation, healthy, vigorous trees, careful pruning, membership in a strong selling organization. Sour orange is the best root stock, broadly speaking. High-budded trees are most resistant to disease. The control of scale insects costs six per cent on $250 for each acre annually. Scale-free districts need not pay this tax. Plowsole and hardpan decrease yields. Maintenance of the humus content of arid soils increases yields. Allowing the roots to dry during transplanting kills trees. Allowing the soil to become too dry once makes trouble for a year. Suckers cannot be depended upon to grow into profitable branches. Frequent pruning of lemons increases yields. Top-working old orchards in usually unprofitable. Orchard temperatures may be economically raised ten degress with oil heaters. Radiated heat is more effective than heat of convection. Fruit decays are caused by fungus parasites. Tent-cured lemons ship better than tree-ripe fruit. Toadstool fungus is fatal to citrus trees. Lemon gum disease may be cured with Bordeaux paste. Scale insects are most economically controlled by fumigation.

CROP PRODUCTION

By Charles B. Lipman, Professor of Soil Chemistry and Bacteriology

Deep soil, meaning several feet free from coarse gravel, hardpan, or standing water, is essential for the production of the best crops in California. Air, as well as moisture, each to the extent of about one-fourth of the volume of soil, are essential to successful plant growth. Plant food in available (or "soil water"—soluble) form is essential to successful plant growth. Maintenance of a plentiful supply of organic matter is essential to successful crop production. A neutral or slightly alkaline reaction of the soil is essential to the successful growth of most crops. Liming maintains such reaction. Soil bacteria are essential factors in successful crop production because they help to make plant food available. Excessive amounts of water-soluble salts (alkali) are detrimental to crop production. The use of barnyard manure in the case of "white alkali" and of gypsum in the case of "black alkali" prevents the toxicity of these salts to a great degree. Fertilizers may serve to add to the store of available plant food in the soil, or may stimulate bacterial and physical changes in the interest of soil fertility, or both.

(This series will be continued another week.)

Working to a Dairy Ideal

Written by Dr. Leroy Anderson for Cultivator Readers. If Ideal is Correct, Success Follows

IN August, 1911, Mr. John H. Guill, Jr., of Chico said in a California live stock journal, "During the past few weeks our farm papers have reported the sale of a Jersey bull for $13,000, the sale of a Berkshire boar for $4,000 and the sale of numerous animals at prices ranging well up in the hundreds. It is not the probable opportunity of every dairyman or farmer to raise a $13,000 animal, but it is absolutely within his power, by simple selection and intelligent breeding, to materially increase the value of his stock. My ideal of dairy cattle was fixed when as a student in the college of agriculture I was sent to the Pierce Land and Stock Company's ranch at Stockton to represent the agricultural station in an official test. The many excellent Holsteins, with their great producing powers set a record of attainment high enough to be worthy the ambition of any man to equal."

CALF HERD OWNED BY JOHN H. GUILL, CHICO.

Mr. Guill has a goodly sized ranch near the city of Chico and he began its management after graduation from the college of agriculture. As to dairy herd, he began with grade cows, largely of Shorthorn type like so many of the dairy herds in California of a decade ago, and in fact like many today, especially in the coast sections.

SOME OF THE GRADED UP COWS OF JOHN H. GUILL, CHICO.

His first Holstein bull was purchased in 1907. This animal was out of a 12-pound cow and sired by Jetze Zwartbok, the grand champion bull which the Pierce Brothers imported from Holland. The next herd bull was sired by Aralia Prince of Riverside, a brother of Aralia De Kol, the cow that gave over 28,000 pounds of milk in a year. His dam was a pure-bred cow of excellent dairy conformation. This bull is still in Mr. Guill's herd. A young bull now in service is Lorena

Citrus and Tropical Fruits

ORANGE JELLY

HP. D. Kingsbury of Redlands has been making investigations as to by-products of the citrus for many years and has maintained a large commercial citrus by-product plant in that city. He is now writing for the Redlands Facts a series of articles from which we quote:

Orange Jelly

This information also applies to lemon jelly and grapefruit jelly.

Orange and lemon jellies made in the home have always required the addition of gelatine to make them firm, because the juices of these fruits by themselves do not contain the jellying principle, called "pectin" in sufficient quantity to make a firm jelly, such as can be made from apple juice and quince juice, which are both rich in pectin.

Nature, however, has provided in both of these fruits, the orange and the lemon, a good store of pectin, but has stored it in a place where it would be most apt to be overlooked, namely in the white pith or rag of the peels, and by using this a firm jelly can be made without the addition of gelatine or any substance not contained in the fruit itself, excepting sugar.

Ripe navel orange juice contains about one and one-half per cent of citric acid, and from 10 to 11 per cent of total sugar, therefore the jelly made from it is apt to be somewhat sweetish and insipid unless some more acid is added to it to bring up the flavor. The addition of acid also aids in the jellying of the juice. This additional acid is supplied by mixing lemon juice with the orange juice in the proportion of about one to six, that is, one pint of lemon juice to about six pints of orange juice, or in any other proportion which best suits the taste of the maker.

Freshly squeezed orange and lemon juices are not clear and pellucid, as they contain a considerable amount of albuminoid matter, and to make a clear jelly from the juice it is necessary to get rid of this sediment. It will not easily filter out from the fresh juice, nor will straining remove it, therefore the jelly has to be made in two cookings on separate days.

From good, ripe, medium sized oranges about an ounce and a quarter of juice can be squeezed with a hand squeezer, and from cured, ripe lemons about an ounce of juice per lemon. The amount of jelly to be made will be approximately double the amount of juice which is used, the additional bulk being furnished by the sugar to be added.

Therefore to make a dozen of the ordinary sized tumblers of jelly it will be necessary to use six or seven lemons and 28 or 30 oranges.

Get out of this fruit all of the juice possible with the hand squeezer, and save the peels. Add one quart of water to the juice to make up for the loss by evaporation during first cooking. Mix the juices and water and put them into the preserving kettle and over a low flame let it simmer for from half to three-quarters of an hour. Do not let it boil hard. Take about half of the saved peels and put them into a muslin bag, tying them in, and place this bag of peels in the kettle with the simmering juice.

When the period of simmering is done, remove the bag of peels, squeezing it out lightly so that no great amount of juice shall be lost from the kettle. Then allow the juice in the kettle to stand for 24 hours in order that the pomace or sediment in it may settle down to the bottom.

Then pour off the clear juice at the end of 24 hours, and to each pint of this clear juice add one and a quarter pounds of granulated sugar. Put it on the stove, see that the sugar is dissolved, bring to a boil, and boil briskly for three minutes, skimming off the foam which arises from the sugar. Then pour the syrup into glasses and set it aside to cool.

If desired, the color of this jelly may be varied in a pleasing manner by adding some clear berry juice to it, or cherry juice in small amount before the last boiling and when the sugar is put in.

The cost in the home will be about 15 cents for the fruit at half a cent per pound; 22 cents for the four pounds of sugar at five and a half cents a pound; 20 cents for the glasses; 20 cents for the actual labor involved; and about five cents for the fuel, making a total of 82 cents for the dozen tumblers of jelly.

As to market conditions, there are very many jellies on the market, of all varieties, and therefore as a commercial proposition the price on the orange jelly will have to be in line with the other varieties. Also, it is hard to sell a single jelly to the trade, as many jobbers quote them a whole line at a time with many different varieties.

Furthermore, it would not pay to have a salesman spend his time on a single line of jelly like this. Also, there must be added to the cost when selling to the trade the cost of the shipping cases, the freight charges to the dealer wherever located, and the brokerage, the jobbers' discount and the retailers' profit must all come out of the returns before the profits to the manufacturer can begin to be figured. There is no foreign competition to this line of goods which need be considered.

PROPAGATING OLIVES

Owing to repeated calls for information as to propagating olive trees we reprint an article written for the Cultivator of December 21, 1911 by J. W. Mills. The article follows:

It has been told in the columns of the Cultivator how in foreign countries the olive is sometimes propagated by burying large limbs a few inches below the surface of the ground and with due care removing the sprouts when they attain sufficient size. These sprouts send out roots below the surface of the soil, and as there is a continual succession of sprouts, a log of olive wood will continue to produce rooted slips for some time. The off-shoots come from adventitious buds. These are dormant buds distributed promiscuously and irregularly beneath the outer bark

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas
California
U. S. A.

Teague trees are started right, grown right, and shipped right.

This process is only of passing interest to California growers, as it necessitates the cutting of large branches from desirable trees.

Hardwood cuttings about one foot in length are ordinarily used, taken in February or March, and planted with an inch or two of the top exposed. It is the experience of some growers that a longer cutting, about 18 inches, is better, as the hot days of midsummer tend to dry them out too fast if the lower ends of the cuttings are only ten inches or so beneath the surface. These cuttings should be half an inch or more in diameter.

The most rapid process of growing young olive trees is the so-called herbaceous method. The hardened tips of the previous summer's growth are used. This means from one to three cuttings taken from each well grown twig. The trees from which these twigs are taken must have been well irrigated and cared for in order to make thrifty cuttings of the right texture. The cuttings should be about three inches long with two leaves at the apex. This requires the removal of the two lower sets of leaves from the cuttings as the well grown twig should have about three sets of leaves in the length of three inches. These cuttings should be about one-eighth of an inch in diameter. Experienced propagators tell us that it is useless to use sucker wood for this method as it fails to make good. This is true of all kinds of suckers. The soft growth at the tips of the twigs that bend easily between the fingers should not be used.

These small cuttings are stuck in coarse sand in flats, about 700 cuttings in a flat, two feet by 18 inches. Usually they are placed in glass houses in which artificial heat is applied, but there is often heavy loss from fungus owing to the warm, moist atmosphere being an ideal condition for this disease.

One of the most successful growers in Southern California has rooted his olive trees by this method, excepting that he used cold frames with manure for bottom heat. This seems to be an improvement over the hot house method and is much cheaper. The plants must be kept continually moist, not even allowing the surface of the sand to become dry. After the young olive trees grow tops a few inches high they should be transplanted to the field nursery without exposing the roots to the air, and watered as soon as planted. Cuttings should be put in the flats now.

The above described method of growing olive trees was first practiced as far as we know in Southern California by Kenneth McLennon, first superintendent of the Southern California substation at Pomona. The idea was suggested to him by Dr. E. W. Hilgard, and immediately revolutionized the olive nursery business.

JOHN'S CHANCE

Wife—Now, John, my sister Belle and her steady are coming to call on us tonight. So you must act the part of an ideally happy married man. She's not quite sure of him yet.

John (savagely)—Leave it to me! That lobster trimmed me in a horse trade once! Leave it to me!—Boston Globe.

EVERY KIND IN STOCK

"Will you direct me to your range department?" asked the lady in the big department store.

"Certainly, madam," replied the polite floorwalker; "rifle, kitchen or mountain?"—Yonkers Statesman.

Deciduous Fruits

APPLE GROWERS USE COLD STORAGE

IN view of the interference with the European market and the large production of American apples this season, specialists of the department of agriculture call the attention of apple growers to the advantages of cold storage for steadying the market at harvest and for lengthening the selling period.

Glutting of the market will result, it is feared, in many thousands of barrels of good apples rotting in the orchard or being disposed of at prices which figure a net loss to the grower.

The following are the directions given by the apple handling specialists of the department for using cold storage successfully in handling apples:

The proper function of cold storage is to retard the ripening processes of the fruit and the development of decay organisms and skin blemishes. The first responsibility for the keeping quality of his fruit rests with the grower since it is his growing and handling methods that largely determine its vitality, freedom from disease, and general condition when stored. Cold storage is not a remedy or a restorative for poorly developed, weak, imperfect fruit, but is the most effective method of preserving the quality, flavor and appearance possessed by the fruit at time of picking.

The first step in successful cold storage of apples has been found to lie in the practice of such culture, spraying and pruning methods as insure production of sound, healthy, well colored fruit, free from disease. Assuming this as the first requisite, the following factors have been found to most influence the keeping quality of the fruit and furnish best conditions for long storage:

1. Proper maturity at time of picking.
2. Care in all handling operations.
3. Prompt storage after picking.
4. A proper storage temperature.

Maturity Tests

Careful and extensive investigations have demonstrated that fruit picked at full maturity can be held for a longer period of storage and is less affected by scale and decay than that picked when somewhat immature. Two important commercial varieties, Rome Beauty and Winesap, have been found to be especially susceptible to scald during storage if picked prematurely. There is no doubt that several thousand dollars are lost to the industry each year through the improper picking of these varieties alone. The results emphasize strongly that more care and attention should be paid to this detail of the harvesting operations than is usually the case.

By full maturity, however, is not meant over-maturity, which may cause fully as heavy losses as immaturity. Each grower should study his own fruit and his own conditions in order to determine the proper picking stage. Probably the most reliable single indication of maturity is the whitening or slight yellowing of the "ground color" of the fruit. This is the color underlying the blush or red color and should not be confused with the latter.

Careful Handling

Care in all handling operations is the second important requisite of successful storage. A class of fungi, of which the common blue-mold is an example, are known to be unable to attack and cause decay of healthy, uninjured fruit. In spite of this fact, very serious rots, both in storage and in transit to market, are the work of fungi of this type, and the largest contributory cause in all cases is bruising or skin breaking suffered by the fruit in the picking and packing operations. Microscopic bruises and breaks in the skin are large enough to afford entrance to the spores of these fungi and the necessity for the utmost care in all operations connected with the handling of the fruit to avoid bruising and mechanical injuries is more urgent than most growers realize.

Prompt Storage

There is a marked difference in condition between fruit stored promptly after picking, say not more than two days later, and otherwise comparable lots of which the storage is delayed ten day or two weeks. Such delay is especially injurious during a period of warm ,humid weather. The delayed fruit at withdrawal from storage is riper, yellower and duller than the corresponding "immediate," stored fruit and in addition develops more serious scald and decay. The importance of eliminating all avoidable delay in storing cannot be too strongly emphasized.

All leading varieties of fruit and ornamental trees.
GRAPES, ORANGES and LEMONS.

Storage Temperatures

Trirty-one degrees to thirty-two degrees Fahrenheit is the standard storage temperature for apples, and this has been found to be the best for long keeping of the fruit. Higher temperatures permit the ripening of the fruit to advance more rapidly than at 31 degrees to 32 degrees Fahrenheit, with the result that the fruit at these temperatures reached the end of its storage life much sooner. In addition the lower temperature retards most effectively the development of fungus decays and skin blemishes. For a short storage period higher temperatures may be used without serious trouble, especially with the better keeping varieties, but for long keeping 31 to 32 degrees Fahrenheit will best maintain the color, quality and texture of the fruit.

Apples should be withdrawn from storage while still firm, and in this condition can be held on the market in satisfactory shape for several days or weeks. If allowed to become excessively overripe in storage, however, they will break down very fast on withdrawal. Apples from 32 degrees Fahrenheit will as a rule hold in better condition after withdrawal from storage than will comparable lots from higher temperatures.

HOME-MADE APPLE VINEGAR

Apple vinegar or cider vinegar is now made by commercial plants to such an extent that the home-made product is rarely seen and has but little place in the market.

Apple cider will go through the normal process of fermentation and develop vinegar of splendid quality if given proper temperature and time for development. As the cider is stored in the barrels it should be exposed as much as possible to the air and be kept at a temperature above 80 degrees and below 100 degrees. The best results will be obtained if the material is kept at a temperature ranging between 80 and 90 degrees. At this temperature it requires approximately a year for cider to develop enough acid content to pass as first-class vinegar. It should have between four and seven per cent of acid content, and with the process of making being that of slow ferment in barrel quantities, it will seldom reach six per cent of acid content. Ordinarily the vinegar that is made by being permitted to ferment in barrel quantities must be kept in a basement or cellar storage where the high temperature can be obtained. It does not kill the ferment in the vinegar to pass below 80 degrees in temperature, but it retards its action, and the longer the material is in the process of making the less valuable it is and the more difficulties are liable to be encountered in the work. The best results will be obtained if the head of the barrel is taken out and the barrel left entirely open. It can be stirred to advantage once in a while, but ordinarily the process of letting it stand entirely undisturbed will develop a very clear and satisfactory grade of material.

The mother of vinegar that develops ordinarily on the top of the barrel is of no special advantage after it assumes the form of a condensed or hard cake. As long as it is in a loose, slimy form it will work fairly rapidly, but as soon as it assumes the caked form it may as well be removed from the barrel. Ordinarily if touched or pressed down on one side it will sink to the bottom of the barrel. The live, active mother of vinegar when collecting appears as a thin or mucilaginous gelatine-like mass and is rapidly reproducing the ferment yeast that is making the vinegar. It is not necessary in all cases to use this mother of vinegar to start the process of fermentation. It is a good plan, however, to use small quantities of it for placing in each barrel of cider to start the process of fermentation. If this is not done a great many different kinds of bacteria will develop in the cider and not all of these will tend directly to the manufacture of acetic acid, which is the valuable acid in vinegar.

The home process of vinegar manufacture is slow, but easily handled, and can in a small way be carried on very satisfactorily—O. M. Morris, Horticulturist, Washington State Experiment Station.

YUCAIPA VALLEY

"Where the Big Red Apple Grows"

San Bernardino County

Eight Miles from Redlands

Many of the young apple orchards in this wonderful valley will produce fruit this year. Land suitable for the apple in Southern California is not to be found outside of this valley, and among the owners are men who spent many years in the northwestern part of the United States. Why did they come to the Yucaipa Valley? Because the altitude (2600 to 3000 feet) is the best for producing winter apples that have the keeping qualities. The best method we have of proving this is to take you to Yucaipa and show you. Many level acres on the South Mesa at $285 per acre, including one share of water stock. This is the time of year to plant trees. Call on or write

GREAT CROPS OF
STRAWBERRIES
And How to Grow Them

IS the most beautifully illustrated and most complete strawberry book ever written. It teaches the **Kellogg Way** of doing things and tells the whole strawberry story from start to finish. It explains how the famous Kellogg Pedigree plants are grown on the great Kellogg plant farms in Idaho, Oregon and Michigan, and pictures and describes all the best varieties, including the ever-bearing kind.

OUR FAMILY STRAWBERRY GARDEN

Whether you have a small garden or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries the year round for less than one cent per gallon. Our Book gives full information.

STRAWBERRIES

Yield more dollars per acre and give quicker returns than any other crop. Get our 64-page book and learn THE KELLOGG WAY, and make **$500 to $1200** per acre. The Book is FREE.

PLANT BERRIES

Alfred Mitting has had 47 years experience with berries from all over the world. His new berry, Macatawa, is the wonder, to all that see it in fruit. It is 3½ inches one way by 3¾ inches the other way. Send a postal card today for his 1915 catalogue with 1 colored plate, including the cream of all berries from a commercial standpoint or for home requirements.

ALFRED MITTING
8 New Street, SANTA CRUZ, CALIFORNIA

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris

OPERATIONS and planting in the flower garden are practically the same as with vegetables. All the hardier annuals may be planted and the perennials for early flowering.

The planting of sweet peas is still in order, as well as asters, centaureas, all the garden pinks, hollyhocks, poppies, phlox, primulus, schyzanthus, stocks and zinnias. Many gardeners plant aster seed in boxes but we recommend the selection of a favored spot in the garden, preparing a light frame around it, and planting the seed directly in this bed, afterwards, when the plants are three to four inches high, transplanting where desired. When seeds are planted in boxes they soon exhaust the nourishment and become dwarfed before large enough to set out. The plants are hardy and easily transplanted. For August blooming the tall varieties should be planted now, as well as the dwarf early flowering which should bloom the latter part of June The new varieties of the King Aster, a cross between the Comet and the Giant American Branching, are proving very popular. Their peculiar needle-like petals give them a most artistic appearance and for private gardens they are unsurpassed.

For small border plants less than eight or ten inches in height the most suitable are English Daisy, sweet allysum, golden feather or pyrethrum, centaurea (dusty miller) and cineraria maritima. Lobelia is also satisfactory but not so easily grown. It should be started in a small seed bed or in seed boxes, the seed covered very lightly with soil or, still better, with ground sphagnum. After they make a growth of two or three inches they may be easily transplanted.

With the abundant rains this spring we would recommend the sowing of a wild flower garden. This is proving a splendid solution of the vacant lot or waste space problem and the seeds may be obtained at the different seed stores as wild garden mixtures. These will furnish blossoms the greater part of the early summer.

Do not fail to plant some of the new early flowering hybrid annual Sweet William. It may be planted now or during the next two months, flowering during the better part of the summer. The old type Sweet William being a biennial required a year or more to come into bloom while this new hybrid will bloom in three and a half to four months. The flowers are larger and richer in color than the old type. It is a novelty, offered for the first time this year.

PALMS

Palms are much used for interior decorations where there is no direct sunlight. Regular watering is essential, with especial cae not to overwater. It is better with most palms to keep them a little dry than too wet. Where a pot is in a jardiniere especial care must be exercised not to have them too wet.

While small, wash the foliage occasionally with soap suds made from a good soap. Immediately folow with a thorough rinsing. When too large for this, spray the tops frequently with clear water.

Browning at the tips usually comes from trouble at the roots:—first, overwatering; second, worms on the roots; third, lack of plant food. The first is the trouble in nearly every case. The worm that gave the trouble is not the ordinary earth worm, but a little white harmless-looking creature that emerges into the air as a small fly. Dissolve a piece of quick lime as big as a tea cup in three gallons of water. After it is through sputtering and the milky mixture has cleared, pour off the clear part and soak your soil with it. Do not dilute, for the soaking should be thorough. To provide plant food, stir small quantities of bone meal and wood ashes into the surface or in place of ordinary watering occasionally use manure water or ammonia water (a teaspoonful of ammonia to a quart of water). Trim off the brown tips, as they will never recover. If the leaves turn yellow, look for scale on the under side and be sure you are not overwatering. Wash the scale off or spray with kerosene emulsion or whale-oil soap, or some nicotine preparation.

Do not repot too often. If a palm grows three new leaves a year it does well.

CHANGING PLANT SEX

Written for California Cultivator
By Albert R. Gould, F. R. H. S., Late of Royal Botanic Gardens, Kew, England

On page 554 in your issue of December 3, 1914, the somewhat startling statement is made by your contributor, Ernest Braunton, that changes are brought about in plants that bear the two sexes of its flowers on different plants. He states "that cases are known in northern Africa where the natives having an excess of male date palms have pulled out the first flower spike in the hope that the next one will prove female, and they are not always disappointed. The second and all subsequent flower-spikes bear nothing but female blossoms and of course bear a resultant crop of dates." He also states "that the paw-paw is more often changed by the same method or by cutting off the whole top of male plants." That "such changes are well authenticated having been vouched for by plant experts employed by Uncle Sam." It would be interesting to hear more on this question as it seems hardly possible to bring about such a great physiological change by this simple method and from what I know of the African natives, their statements are not always reliable. The date palm (Phoenix dactylifera) in contrast to many other genera of the palmae is dioecious.

In the case of the paw-paw (Carica papaya) this is also said to be dioecious, but I have on several occasions in west Africa found plants of this which are monoecious, and I can therefore quite understand how Uncle Sam's plant experts have been probably deluded. The paw-paw appears to show variations, and it would be difficult to prove that plant sex had been changed in the case of a plant which is sometimes monoecious i. e., bearing both male and femal flowers on the same plant. Personall I should hardly credit your contributor's statement.

Small Fruits Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris

FEBRUARY is spring planting month, so to speak, and all the hardy vegetables may be planted with the exception of a few vining plants, such as melons, cucumbers, squash, etc. While it may still be a little early for corn yet in favored localities fair success may be had with some of the early varieties, one of the best being Golden Bantam. This is a dwarf variety and an early producer, maturing in about seven weeks. It makes a very good all season corn but owing to its dwarf habit the ears are rather small. The quality, however, is first-class. For a later corn probably the best on this market is Wilkes' Big Four, so called on account of its productiveness and large ears. Being fairly early it is one of the first market corns we have. Large plantings of beans should not be made at this time but, like corn, one may make small plantings of Canadian Wonder or Early Valentine in warmer sections. If the weather proves favorable these will come along all right and furnish early beans. With peas the best varieties for February planting are Yorkshire Hero, Dwarf Telephone and Stratagem. The two latter varieties are proving remarkably profitable to growers, producing larger peas than the Yorkshire Hero and being quite as productive, or even more so. The Dwarf Telephone is practically the same as the tall or Vining Telephone except in habit of growth. It is one of the sweetest peas that we have.

Peppers, tomatoes and egg plants should be planted in hotbeds. These require but light covering at night, a good piece of muslin will protect them from cold and beating rains. Eggplant and cucumbers require a little more bottom heat than do the tomatoes and we would recommend a good hotbed for these, say at least six inches of manure to give sufficient warmth.

There has been more or less complaint in regard to the different strains of Chinese Giant peppers during the last two or three years but this season there is an abundance of first-class, large fruiting Chinese Giant stock to be had. This is a strain of the original Chinese Giant and it is being placed on the market as Chinese Giant Special Strain or Magnum Dulce. This is one of the most profitable strains of the Chinese Giant we have ever seen and those who want large, heavy fruits will be pleased with this variety.

Among the early tomatoes the variety known on the Los Angeles market as First Early is undoubtedly the most productive early tomato grown. It has a large, smooth, round fruit and produces early crops. For a later, all purpose fruit the Dwarf Stone or the New Stone and the Globe are the best, while the Beefsteak or Ponderosa is still later. This latter is a fine slicing tomato. However, it should not be planted for early fruiting as it will not set until late summer.

THIS MONTH IN THE SACRAMENTO VALLEY

Written for California Cultivator
By S. S. Rogers

THROUGHOUT the Sacramento Valley the month of February for the market gardener is in many respects the most important period of the year. In order that high prices be realized from vegetables they must be placed on the market as early in the season as possible. The returns from many crops such as green vegetables, potatoes, etc., is generally high at the beginning of the season and the difference of a few days is often responsible for a large decrease in value.

In many sections of the valley the conditions are such as to make the production of early spring vegetables possible providing the grower will take advantage of the warm weather which generally comes during this month. In many localities potatoes may safely be planted at any time after the first week in February. There is a certain amount of risk attached to planting early potatoes and it would not be advisable to plant a large amount of acreage at this time, with the exception of a few especially favorable sections.

The writer suggests that if the grower is planning to grow 40 acres of potatoes he seed between five and ten acres as soon as possible. From the middle or the last of February a planting of 20 acres or so might well be made, and putting in the remainder of the land between the first and the middle of March. The Early Rose and American Wonder varieties can be used for the early planting. For the later planting the American Wonder will be found desirable.

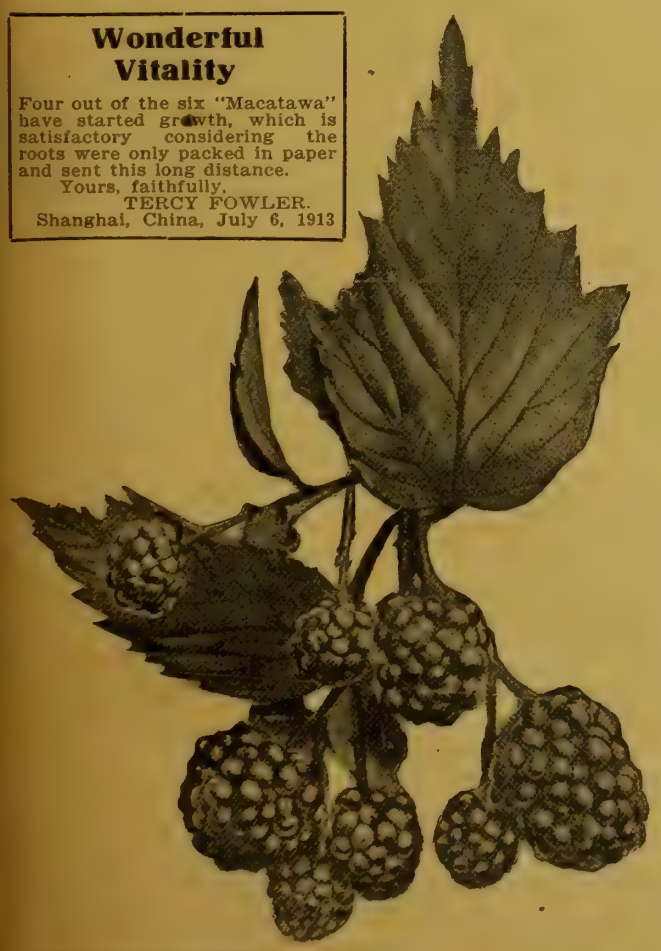
By use of the hot bed or the cold frame (direction for construction printed on page 555 of the California Cultivator of December 3, 1914) such seeds as tomatoes and peppers can be planted. As a rule the demand for green peas maturing between April and June will warrant the planting of quite an area during this month, using such varieties as the American Wonder, Premium Gem, Telephone and the Extra Early Market. If tomatoes are to be grown the Sparks' Earliana is probably the best early variety to be had and the Stone should be used for the general crop.

In order that seeds may germinate well and the various vegetables grow as rapidly as possible the field should be put into the finest condition possible before planting. If manure has been applied during the previous month it will not be advisable to replow at this time, for by so doing the fertilizer is brought to the surface, which is undesirable. It is necessary that the soil be worked thoroughly to a depth of from six inches to one foot, and this can be accomplished satisfactorily by the use of a disk. After the land has been worked it should be harrowed and ring rolled or clod mashed until all the lumps have been pulverized. If the soil is of such a character that it runs together and bakes badly after being wet a second harrowing after it has been smoothed will be found helpful. The thorough working of the soil before planting not only aids the seeds in germinating but materially prevents weed growth and is very important when growing such vegetables as onions, radishes, beets, etc.

New Macatawa Everbearing Blackberry

Wonderful Vitality

Four out of the six "Macatawa" have started growth, which is satisfactory considering the roots were only packed in paper and sent this long distance.
Yours, faithfully,
TERCY FOWLER.
Shanghai, China, July 6, 1913



THE MACATAWA originated by Alfred Mitting, in 1909, at Holland, Michigan, a cross between the true Giant Himalaya and the Eldorado, and offered to the trade in the fall of 1912. I have named it the Macatawa as that term carries to me the idea of our cold Michigan winters and our occasional dry summers, which this berry stands without the slightest damage. It went through the extreme cold winter of 1911-12 in an exposed condition without freezing. The Macatawa has characteristics of both its parents. The fruit is very large and sweet, in fact it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe, and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way, by three and one-fourth inches the other way.

It begins blooming in the southern and coast states about February 15. In the eastern states about April 1st. One month later you can begin to pick. It is a continual cropper from Spring until the frosts, in fact it is the only berry in my 46 years' experience that is an everbearing variety.

Its habit is similar to that of the Eldorado, but self branching, and the bloom is almost semi double, about the size of a silver dollar. So far, all who have tried the berry, say that it is the sweetest and best flavored berry they ever tried. When it was in fruit at Berrydale, it was admired by everyone that saw it, and three thousand plants were sold to said visitors, in the fall of 1912. The young plants come from suckers and not from tips, but it is a shy sucker maker, so we propagate by digging up the roots between the rows and cutting same into one, and one and one-half inch pieces. These piece roots are sown in rows four inches deep, and the rows two feet apart. They should be sown in the southern and coast states from December 1st to March 1st, in the center states from March 1st to May 1st. By the next fall you will have nice plants full of fiber roots, and the plants will be 18 inches high and ready to plant in the field for fruit. Our price for these piece roots is $10 per thousand, one year old plants, $2 per dozen, $12 per hundred, $100 per 1000. 50 plants go at 100 rates, 500 at thousand rates.

The Macatawa Berry is 3½ inches one way by 3¾ inches the other

Macatawa Is a Great Berry for Canning

COMMON SENSE IN BUYING TREES

Many planters overlook the importance of buying good trees.

The first cost of the tree is the smallest item. You spend years of time and lots of money before you know what your trees will produce. So-called "cheap" trees are seldom cheap.

It is the extra fancy fruit that sells quickly and brings big profits. Thousands of growers will tell you that Roeding's trees grow true to name and are the most satisfactory kind to plant. We grow everything that grows, but specialize on fine citrus and olive stock.

Free Service

We have a special service to offer every purchaser of our trees, that costs you absolutely nothing. It means protection for you against costly mistakes—help in planting, pruning, spraying, irrigating, marketing, etc. Write today for further information.

Write or Call and See Us

Send us your list of what you expect to plant this season and we will be glad to quote our lowest prices and offer our suggestions.

Roeding & Wood Nursery Co.

General Agriculture

KELP AS A BY-PRODUCT

THAT the giant sea-weed of the Pacific Coast, known as "kelp," can be profitably made into commercial fertilizer in the same plant where fish scrap is manufactured is a suggestion in a new bulletin (No. 150) of the United States department of agriculture entitled "Utilization of the Fish Waste of the Pacific Coast." The rendering of fish waste requires more specialized apparatus than the drying of kelp, but the amount of fish waste that could be utilized would keep the plant busy for so short a season that one factory could well be expected to attend to both.

With a plant fully equipped for the large-scale rendering of fish waste, all the equipment necessary for treating kelp, with the exception of a kelp harvester, has been supplied. Scows and tugs designed for the collection of cannery waste can be applied to the harvesting of kelp. The unloading elevators, storage bins, and conveyors within the plant are entirely adaptable to chopped kelp. Since the kelp is not to be cooked or pressed the conveyors should be arranged with a view to the transference of the material directly from storage bin to drier. And the drier, of whatever form, probably would be found quite suitable for drying kelp.

Assuming the canning season, for example, in the Puget Sound region to be confined to the months of July and August, the equipment of the rendering station can be applied to the treatment of kelp during the months of September, October, and probably November, thus more than doubling the activity of the plant.

The capacity of the drier for the plant should be in actual practice about 50 tons per day which is equivalent to about 500 tons of wet kelp. Furthermore even during the canning season when the amount of fish waste available is not sufficient to keep the plant running at full capacity, kelp may be harvested and dried as a supplementary operation.

The following estimates may serve to convey some idea of the cost and profits to be expected from the supplementary operations on kelp. Since the drier has a capacity of 50 tons dry kelp, the capacity of the plant is limited to the equivalent weight of green kelp, which on the basis of 10 per cent solids in the green is 500 tons. This it is assumed could be harvested and unloaded at 50 cents per ton. Such an amount of material probably would require at least two cutters and five barges of 100 tons capacity each; and to tow these to the factory dock two tugs would be necessary.

During the season when cannery waste is being collected the labor required would be on wages, whether actually employed or not. Under such circumstances the labor cost need not be considered but only the actual expense of operating the tugs and cutters. After the close of the cannery season, however, the cost of labor would have to be borne by the kelp. Any estimate of this cost would be difficult and perhaps misleading, but it scarcely would be under $50 per day. About one-half of this estimated cost of labor would be included in the cost of harvesting and the balance in the cost of drying and sacking. The drying it is estimated would cost $1 per dry ton. To sack the product $2 per dry ton is a fair estimate, as a sack would hold over 100 pounds; the bags would cost something less than 10 cents, including string.

The principal expenses of operation may be itemized as follows:

Harvesting, 500 tons, at 50 cents	$250.00
Drying, 50 tons (dry), at $1	50.00
Bagging, 50 tons, at $2	100.00
Overhead charges, selling, and depreciation, 50 tons, at $1	50.00
Total	$450.00
Freight to Eastern centers, at $6	300.00
	$750.00

The proceeds from the sale of the product may be estimated as follows:

On basis of retail sales, 50 tons, at $22.94	$1,147.00
On basis of wholesale sales, 50 tons, at $16.45	822.50

An estimate of daily profits may be made as follows:

Retail basis:	
Daily proceeds	$ 1,147.00
Daily expenditures	750.00
Daily profits	397.00
Profits for 30 days' operation	$11,910.00
Wholesale basis:	
Daily proceeds	$ 822.50
Daily expenditures	750.00
Daily profits	$ 72.50
Profits for 30 days' operation	$ 2,175.00

While very great accuracy cannot be claimed for these estimates, as they are based on experince with materials other than kelp, it is believed that they are approximately correct and can be taken as an indication of what the items of expenditures and proceeds may be. They indicate strongly that a plant erected and equipped for rendering cannery waste can be applied with profit to the treatment of kelp. The proviso that the plant be equipped with a drier of large capacity must be introduced. In the beginning of the proposed industry the market on the Pacific Coast would consume the entire product, so that the high freight rates to the Atlantic seaboard could be avoided. This would add materially to the profits.

SECURITY

Orchard Ladders for your pickers will bring results to you. Insure the pickers' safety. He will do better work.

Farm Bureaus and Institutes

FARM BUREAUS

Schedule of meetings through February:

Madera County, Thos. C. Mayhew, Adviser, Madera

Chowchilla	February 1
Madera	February 6
Dixie Land	February 9
Fairmead	February 11
Eastin	February 12
Coarse Gold	February 25
Oakhurst	February 26
Nipinnawasee	February 27
North Fork	February 29

San Joaquin County, Frank F. Lyons, Adviser, Stockton

Thornton	February 1
Stockton	February 3
Acampo	February 5
Lockeford	February 8
Linden	February 10
Escalon	February 12
Stockton, Directors' Meeting	Feb. 13
Farm Advisers' Convention at Berkeley	February 15-21
Holt	February 24
Ripon	February 25
Manteca	February 26

San Diego County, Jas. A. Armstrong, Adviser, San Diego

—First Week—

Encinitas	Monday, February 1
Vista	Wednesday, February 3
Fallbrook	Friday, February 5
Directors' Meeting, Saturday, Feb.	6

—Second Week—

Escondido	Monday, February 8
Julian	Wednesday, February 10
Dehesa	Friday, February 12
Office	Saturday, February 13

—Third Week—

Conference of Farm Advisers at Berkeley.

—Fourth Week—

Chula Vista	Tuesday, February 23
San Ysidro	Wednesday, February 24
Poway	Friday, February 26
Office	Saturday, February 27

Alameda County, W. H. Nixon, Adviser, Hayward

Hayward	Monday, February 1
San Leandro	Wednesday, February 3
Castro Valley	Friday, February 5
Murray Township, at Livermore	Monday, February 8
Pleasanton	Wednesday, February 10
Oakland Day	Friday, February 12
Newark	Tuesday, February 23
Niles	Wednesday, February 24

Probably no meeting at Centerville or Irvington on account of state conference of farm advisers at Berkeley, February 15 to 20, inclusive.

Napa County, H. J. Baade, Adviser, Napa

Dr. Cady's schedule in Napa County has been changed from the previous announcement so that it now stands as follows:

Rutherford	February 1
St. Helena	February 2
Berryessa	February 3
Pope Valley	February 4
Calistoga	February 5
Carneros	February 8
Brown's Valley	February 9
Coombsville	February 10
Salvador	February 11
Wooden Valley	February 12

This change has been made for the reason that the farm advisers of the state will have a conference at Berkeley from February 15 to 20, inclusive. All persons interested should note the dates carefully, since this change has been made necessary. Any questions on hog cholera control or hog management will be gladly answered by Dr. Cady at the time he visits this county.

The farm advisers' schedule for the remainder of the month is as follows:

Conference of farm advisers at Berkeley	February 15-20
Mt. George	February 22
Fly District	February 24
Howell Mount	February 26

During the month of February hog cholera control and poultry management will be discussed at the center meetings. The regular schedule of the farm adviser will be dispensed with, his meetings occurring on the dates mentioned above. This change is for this month only; in the future the regular schedule will be followed.

Jeffery Builds The Foremost Six

THE Jeffery Chesterfield Six is a car so perfect in style and quality that not even the most critical engineer could describe any of its features as other than the very best.

No car has ever been built with body lines more harmonious. The Chesterfield is a true style-carriage, in which the streamline has been carried out in perfect European design. Most so-called streamline cars are not truly streamline. The lines of a bird's body, however, the lines of a yacht's hull, and the form of the Jeffery Chesterfield Six are perfect types of streamline.

Jeffery spends an extra $1,000,000 a year to insure the quality of material and manufacture in Jeffery cars. The purpose of the great organization is not to build cars for a price, but for an owner.

How thoroughly Jeffery insists upon super quality is clearly shown in the Chesterfield Six specifications.

Every Chesterfield is fitted with a small bore, high speed motor that marks the farthest reach of modern engineering. It is vibrationless, flexible, powerful. When you drive it you perceive that the Chesterfield is quite as unusual in its ability as in its appearance.

Every Chesterfield is driven through a worm-drive rear axle, the ultimate type of quiet, wear-proof, efficient drive. You absolutely cannot hear the axle.

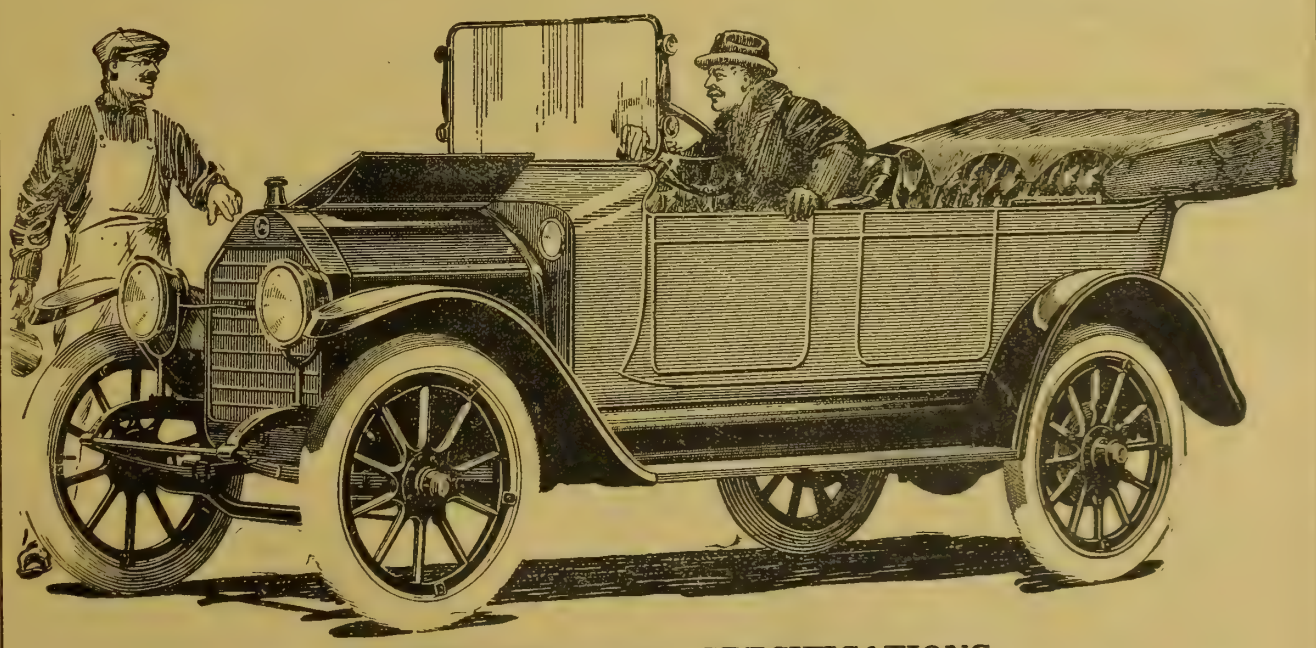
Every Chesterfield uses a trouble-proof, three-plate dry-disc clutch whose smoothness of operation improves upon any other type we know.

Every Chesterfield transmits its power through Spicer universal joints and Daimler leather coupling.

Every Chesterfield is lighted and started by the Bijur system. The quality of this installation is evident from the fact that it is used also by the most popular high-priced car in America.

Read the specifications through, and you will be greatly pleased to see how at every point the Jeffery Chesterfield Six is built along lines which you know look solely to an owner's interest and not to low manufacturing cost.

If you wished, you could not buy a better car.



CHESTERFIELD SIX SPECIFICATIONS

The specifications below, you will immediately see, have never been embodied in any car at any time.

Motor: High speed, high efficiency bloc type; 35-42 horse power. Bijur two-unit starting and lighting system, used in the most popular high priced car in America.

Transmission: Four forward speeds and reverse. Worm drive, full floating, ball bearing rear axle. Imported annular ball bearings. Three-plate dry-disc clutch. Spicer universals. Daimler leather coupling. Rich Tungsten steel valves—require no grinding or other attention. Bosch ignition, magneto, cables and plugs. Cantilever spring, self-oiling spring bolts. Combination constant level splash and gravity feed lubrication, with indicator on dash. Gemmer steering gear. Eighteen-inch corrugated steering wheel, with signal button in center. Left drive, center control. Two sets internal expanding brakes—14x2 inches. Side rails frame extended under sills of body—most rigid construction possible.

Honeycomb radiator—European design. Demountable rims with lugs. Crown fenders. Wheel base, 122 inches. Body: roomy, five-passenger. Weight: 2850 pounds, as shipped.

Equipment: Rain vision ventilating two-piece windshield shaped to cowl; One-man Neverleek top and boot; Collins curtains; Stewart-Warner speedometer with Empico drive enclosed in axle shaft; Waltham clock; power tire pump; Solar electric headlights with one bulb of five intensities; seamless pressed steel round gasoline tank with gauge, carried in rear, with Stewart vacuum feed; combination wash and trouble lamp; extra demountable rim with carrier; Klaxet horn; ammeter; robe rail; foot-rest; full set of tools, tire repair outfit, and jack. Cloth upholstery optional.

Jeffery Four, $1450; Jeffery Chesterfield Six, $1650;
Jeffery 7 Passenger Six, $2400

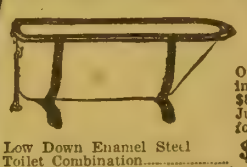
"I Saved $400.00 on My House and Barn by Buying Building Material from the Whiting-Mead Commercial Co."

This is an actual statement made by one of our customers. You can do the same. You can save from $25.00 to $40.00 on every hundred dollars' worth of building material you need by buying direct from us. We cut out the dealer's profit. If you are going to build or repair a house, barn or auto shed—study these prices carefully and be sure to send coupon below for our Big Free Catalog.

THIS SPECIAL STEEL ENAMEL BATHTUB

A wonderful bargain! Made of finest galvanized 24-gauge steel. Outside finished with a rich Sky-blue enamel, bronze trimmed. Price only $8.00



Others larger in size at $8.50, $9, $10. Just the thing for your house.

Low Down Enamel Steel Toilet Combination..... $12.50
Complete to floor—wonderful value.

Low Down Vitreous China Closet Combination..... $16.00
Special value—worth $22.50

Big values in High Tank Toilet Combinations..... $10.00
Complete to floor—a bargain.

Special Bankrupt Stock of Kitchen Sinks. All sizes—up from..... $1.00

Best Quality Porcelain Lavatories; every one guaranteed—$10 down to... $3.75

Standard House Paints. High grade—24 colors—per gal..... $1.50

Black Graphite Roof Paint—per gal..... 50c

Standard Roof Paints—red, green, gray—per gal..... 85c

Shingle Stain, made from pure ground colors—per gal..... 50c

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you. Weship direct.

ROOFING PAPER—1-ply, plain or sanded—per roll of 108 sq. ft... $1.25

—2-ply only $1.50 per roll. Cement and nails ready to lay included in above price. Send for free sample.

WIRE FENCING at Half Price—per rod..... 35c

Extra heavy Field Wire, 6-inch galvanized mesh. Perfect condition; 55 inches high, 20 rods to the roll. This is just about half price. Don't pass up this big opportunity. Send us your order, your money back if you are not satisfied.

GALVANIZED BARB WIRE—per roll of 80 rods..... $1.75

Our Light Wire Special, slightly water stained in shipping otherwise in perfect condition.

Special heavy galvanized "Waukegan" barb wire, 80 rods to reel, weighing 100 to 115 lbs., only $2.75 per 100. Going fast! Don't miss this opportunity.

Lowest price yet on CORRUGATED GALVANIZED IRON—per hundred square feet..... $3.55

Look at this! Corrugated galvanized iron, 2-inch corrugattions, from 6 ft. to 10 ft. long. This is in perfect condition and won't last long at this special price.

WALLBOARD

The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.

Cheaper and neater than plaster or lumber, and any one can install it in one-quarter of the time. Per 1000 square feet..... $19.00

This is a $30.00 Value.

Special—NAILS—In 100-lb. kegs—per keg..... $2.20

This is an unequaled price for 20, 30, 40, 50 and 60 penny common nails. We also carry all sizes and finishes at $2.20 per 100 lbs. base.

LUMBER, SASH AND DOORS — Lowest Prices on Rough and Finished Lumber

2-inch Redwood as low as $12.00 per 1000. 1 in. x 6 in., 8 in. and 10 in. length, 8 to 18 ft., going at $15.00 per 1000. 8 ft. x 12 ft., galvanized all-metal frame skylights glazed with ribbed glass, suitable for hot-house, roofs, etc., crated, $12.00 each.

Two-light double hung windows 1⅜ in. thick, best quality American window glass, all sizes..... 60c

No. 1 Colonial Door Selected Kiln-Dried Oregon Pine — all stock sizes—$1.50 up.

Second Hand Building Material

At Wreckage Prices!

Carried only by Whiting Wrecking Co.

You can buy anything in the Building Material line second-hand, at one-half to two-thirds less than the price of new material. We do 95 per cent of all the wrecking done in Southern California.

Wonderful bargains! Be sure to write for estimates on anything in second-hand Building Material to the

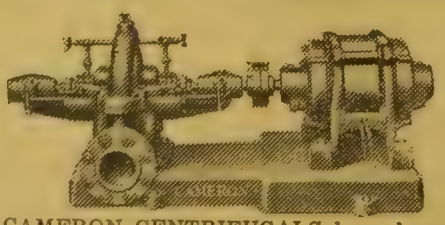
CAMERON IRRIGATION PUMPS



For the continuous and exacting work in irrigation pumping, you want pumps that are simple and dependable with the least attention.

CAMERON CENTRIFUGALS have been designed and built with the special aim of producing a combination of high working value and low operating cost. Simple and strong all through. Finest material and workmanship. Highest efficiency. Backed by an experience of over fifty years. Can be operated by motor, gas engine or belt.

Put your pumping problem up to us. No obligation. Write for free bulletin 15-LC.

Irrigation Forestry

WORK OF TRI-COUNTIES' REFORESTATION COMMITTEE

IN his annual report Francis Cuttle of Riverside, as president of the Tri-Counties Reforestation Committee, says the Riverside Press, reviews the excellent work done by the committee during the last year, and makes some interesting recommendations.

His report shows that for 200 days last winter an average of 4448 inches of water from the Santa Ana river was spread on gravel beds. This method of conservation of water has been used for several years by the committee, and has proven successful. The work is to be enlarged immediately.

Riverside, San Bernardino and Orange Counties are joined in the Tri-Counties Reforestation Committee, organized to promote water conservation in the San Bernardino mountains.

Cuttle's report to the members of the Tri-Counties Reforestation Committee at its annual meeting at Riverside was in brief, as follows:

The committee has furnished two extra men for fire patrol for three months of the driest portion of the summer for the protection of our watershed, which work was done in cooperation with the forest service. The season was one of great danger on account of the rank growth of the fire lanes and trails, following the heavy rainfall of last winter, there being 145 fires started, only three of which got beyond control, but approximately 4300 acres were burned inside the national forests and 3887 just outside. The damage to the watershed cannot be accurately computed, but it is placed by Mr. Charlton, forest supervisor, at $6000. Seventy per cent of the fires were started by campers throwing away matches, cigarettes, cigars, etc.

Cuttle advocated the committee endorsing a law being enacted creating a game refuge of the whole of the Angeles national forest as only about one-third of 1 per cent of the visitors to the Angeles forest are hunters, it would be a source of great pleasure to the largest number to have harmless wild animals protected, and would also cause less danger from fire, owing to the fact that hunters go into isolated places, where when fires are started it is difficult to reach them in time to prevent serious loss to the watershed cover.

The Newlands River Regulation bill and its provisions as affecting the people of the West, if it is enacted into law and sustained by the courts, was also touched upon by Mr. Cuttle. This bill has provisions broad enough to affect every section of the country in assisting in the storage and conservation of water by all known means. He urged the endorsement of a resolution in favor of the Newlands River Regulation bill.

The work of the Water Conservation Association during the past year was as follows: About 4448 inches of water average for 200 days was diverted and sunk into the gravels of the debris cone of the Santa Ana river, the upper contour ditch is being enlarged and brought to grade, carrying twice as much water as heretofore. A short boulder and wire dam as designed by W. E. Pedley has been built at right angles across the Santa Ana river at the intake of the loose boulder dam used for the past five or six years. This dam will be a test of this method of construction which may be valuable later as demonstrating the practicability of this method of construction should the association desire to enlarge its conservation system.

Cuttle closed his report with the words of J. B. Case, president of the International Irrigation Congress in his greeting for the year 1915:

"The real dream of the empire is not a spectacle of embattled columns, of charging regiments, of roaring cannon, nor even of victorious banners, telling of conquests on war's red fields. It is a vision of happy homes, where a contented people thrive under a helpful government, where none is over-rich, where none is poor, but where all share in the beneficence of earth's vast store-house of plenty. With the waters spreading their bounty over the thirsty land, with the wide reaches of our plains transformed into productive farms, America may be the haven of all who seek the fullness of life. To realize this vision is America's problem today."

PURCHASING AN AUTOMOBILE

A common mistake made by most people who purchase a car is to purchase, and then find out the things they would have had different had they known.

There are many things about the car that the purchaser could have had at the time of purchase, or, for a very little extra cost, could have had added to the car.

There is the size of tires; in order to get a car down as cheap as possible the manufacturer sometimes puts on as small a tire as will carry the car, when if a purchaser would insist on a tire one-half an inch larger, he would get almost twice the mileage and have infinitely less tire trouble. Most blowouts are caused by undersized tires or insufficient air in them. A tire will not blow out nearly so quickly with the right pressure as it will if allowed to mash down on the sides and break the fabric.

You will find, if you keep a tire pumped to the required pressure it seldom blows out, but will wear out instead, without giving much trouble.

I have heard some say "I only ran it flat about half a mile." It may injure a tire so it will be ruined by runing it a much shorter distance than half a mile.

The best thing to do is to stop when it goes flat and fix it, or take it off and run in on the rim if you must go a short distance.

A great many people are getting to understand the advantages of over-size tires and some agents are equipping their cars with them.

Another thing is to see that front and rear tires are the same size, otherwise you will have to carry two cases and two tubes to have an extra case and tube for both front and back wheels.—R. A. Bradley, Colorado, Agricultural College.

Country Life Clubs

Clubs Established by Extension Division California College of Agriculture

"HOW CAN THE HOME EXTENSION CLUB MAKE A SUCCESS OF THE FARMERS' INSTITUTE?"

By Mrs. G. F. McCarthy Before Esparto Home Extension Club

IN considering this question let us look for a few moments at the object of the farmers' institute. What is the reason for holding one?

When a young man arrives at that time in his life, when he must earn his own living, does he buy a set of books, rent an office, hang out his shingle and announce to the public that he is ready to fight its legal battles? Does he buy a set of surgical instruments and in like manner notify the people that he will attend to all ills that flesh is heir to? Does a young woman ever think of starting out as a teacher, a dressmaker or stenographer by simply investing in the implements used in such pursuits. You say, "Certainly not." They will spend years of time in hard study fitting themselves to the very best of their ability to make a success of whatever vocation they may choose.

When once they have begun their life work do they cease their study? No, a number of times during the year we will read of the teachers' institute being held which must be attended at least once a year by every teacher in the state. We will also notice that the county medical association held its monthly meeting at a certain time and place and that Dr. So and So read a paper upon the prevention of tuberculosis, Dr. Somebody else spoke of some very important investigations which were being carried on along other lines. Always studying and working out better methods of doing whatever they are concerned with.

But how is it with the farmer? Years ago it was thought that one did not need to know anything especial to farm. One would go along in the same old rut doing just the same from year to year as his father had done before him. But gradually the state of affairs has been changing in this, as well as in other vocations, until the fact has been made plain that education is just as important a factor in farming, dairying, stock and poultry raising, as in any other professions. And so has come about the establishment of the farmers' institute.

With the advantages offered by the state agricultural college, the experiment stations and the bulletins published by the United States department of agriculture, as well as the state bulletins, there is no reason why a farmer should not be as intelligent and practical as any other person.

Closely associated with the work of the farmers' institute is that of domestic science which is intended to lighten the burdens of the overworked housewife. This brings us to the question of what the home extension club can do to make a success of the farmers' institute.

Some of our members may say "I am not a farmer's wife, therefore am not especially interested." Did you ever stop to think that when the farmer is not prosperous it to a certain extent affects others? Ask the merchant if a season of poor crops affects his business. Ask the manufacturer if he can notice any difference in his output if the harvest be good or poor. Did you ever hear a farmer say, "Well, if we have good crops this year we can have an automobile or if the almonds do well I think we can have the new rug Susan has been wanting? Perhaps we can go to the coast for a little vacation this summer if the apricots and peaches are as good as they promise to be." These are common expressions. Can you see by them where there is a benefit to anyone besides the farmer?

The members of the home extension club can show an interest in the work by making their plans to be present as often as they possibly can at the sessions. Mark the three days on your calendar and try to arrange your work so that you will be free to attend. Let it be known beforehand if there is any particular subject upon which you wish instruction. Talk about it among your friends. You do not know where a hint may be given that will lead to something which may prove of inestimable value.

John Deere Implements

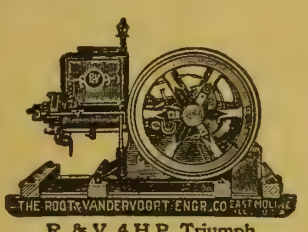
R. & V. Gasolene Engines

New Triumph One Horse Engine. Just the engine for light work about house and barn, such as running washing machine, pumping water and operating other small machines. Saves every member of the family work and worry.

A reliable, efficient, low priced but high grade engine. Easy to start, smooth running, requires no attention when in operation, economical in use of fuel and perfectly safe in and around buildings. All working parts are back of the fly wheel out of the way—a neat outfit in every respect.

R. & V. Triumph Engines for All Farm Machinery

The R. & V. Triumph line of engines is also made in 2, 4, 6, 8, 10, 12 and 16 H.P. sizes, stationary and portable. Every farm can use one or more of these engines to advantage.

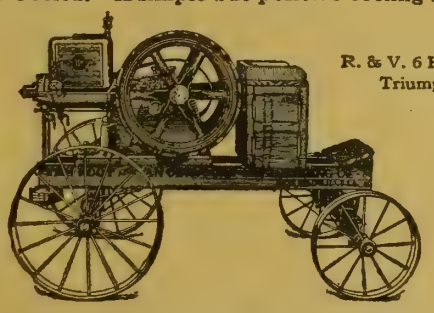


R. & V. 4 H.P. Triumph

They are dependable gasolene engines—always develop rated horse power.

An extra ring over the piston pin prevents scoring and ruining cylinder. This is an unusual precaution for lengthening the life of a gasolene engine. This careful attention to details is followed in constructing every part of the R. & V. Triumph.

Hopper Cooled. A simple but positive cooling system.



R. & V. 6 H. P. Triumph

The gasolene tank for every R. & V. Triumph Engine is most conveniently and safely located—on practically all of the stationary engines it is in the sub-base.

Write for free booklet "Letting Gasolene Do It." This book tells how you can save time every day in the week by using an R. & V. Triumph Engine.

John Deere Wheel Plows

With Quick Detachable Shares

John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

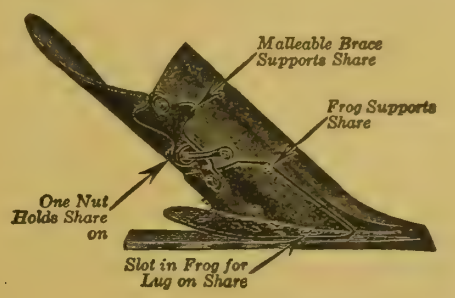
These shares are popular with farmers—they make hard work easy.

Superior Features

Unscrew One Nut—That's All

Unscrew one nut and the share comes off—slip share on, tighten the one nut and you are ready for work.

The share can be removed in thirty seconds and replaced in sixty seconds. Takes from eight minutes to half hour to change old style bolted shares.



Here's what John Deere Quick Detachable Shares mean to you:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang
(High Lift Frame Plows)

John Deere Stag Sulky and Gang
(Low Lift Frameless Plows)

John Deere Two-Way Sulky
(Side Hill or Irrigated Land)

John Deere Engine Gangs
(For Traction Engines)

Write for the booklet above that you want and we will send it to you free.

Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X111

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SAVE THE BIRDS

The department of agriculture is sending out warning that migratory birds are now protected by federal law. Under the provisions of this law no water fowl may be shot in the northern breeding zone after January 15. Officials have been appointed to look after the enforcement of the regulations of this law.

MORE POULTRY

The poultryman is aghast at the prices to which wheat is mounting. The margin has been narrow enough in the past and with wheat at nearly double former prices and other grains following closely it is evident that closer figuring will have to be done and other feeds used as far as possible. With little question many people will be influenced to drop out of the poultry industry and more will reduce their output until they see smoother sailing ahead. But there is little question that good prices will prevail and if early hatches can be made fall layers may induce full baskets when the longest prices prevail. A period of closer figuring during the next year or two may prove of benefit to the entire poultry industry.

MILCH COWS

In 1910 there were 20,625,000 milch cows in the United States. This number held practically stationary until 1914. That year a slight increase was shown, and during the past year, up to January 1, 1915, the percentage of increase was 2.5. Now there are in this country 21,262,000 milch cows. The valuation however shows a greater increase than does the number. In 1910 the cows were valued at $727,000,000, while on January 1, 1915, the valuation was $1,176,338,000.

PLANT TREES

Next week's Cultivator will give considerable attention to the planting of trees and small fruits. This is the planting season and everyone who intends to plant deciduous trees or small fruits should have them in the ground at once. A fund of valuable information is being gathered for next week's paper. It may have some suggestions for even the experienced planter; it certainly will have many for those who are this season planting their first trees in California.

RAKER BILL

The campaign carried on by practically all Pacific Coast apple growers to secure standardization of apple packages must be continued a little longer. The Raker box bill which has been before the national congress has lost its place on the calendar and has been laid over until the next session. The entire proceeding will then necessarily be renewed. It is charged that bad faith was shown in the management of this bill and politics of not very high grade worked in order to do it to death. The only thing for Western apple shippers to do is to take a new start and insist on fair treatment at the hands of the national congress.

IMPORTING MEAT

The secretary of agriculture recently addressed a Topeka audience, laying stress on the fact that the American farmer is continually exporting wheat and continually importing meats. We have also seen the statement that money received for our wheat exports would hardly buy the phosphoric acid to return to the soil to recompense it for the great drain made upon it.

We believe the tendency is toward a great increase in animal industry, but it should be encouraged by all possible means, for it now seems that our country may some day be compelled to seek far and wide for the fertility to replace the drains which have been made upon our soils. The best way is to provide against this by raising more live stock, which means greater fertility and a greater proportion of the original fertility retained on the lands.

MORE HORSES

Notwithstanding the statements made of the immense shipments of horses and mules to European battlefields the fact remains that according to census figures there are more horses and mules in the United States than on January 1 of 1914. In fact there was an increase of 233,000, or, in percentage, an increase of 1.1. The statement has been made that the shipments from this country to France alone aggregated 300,000 horses, while the census reports show that all horses shipped from the United States during the last few months total less than 100,000.

This statement is not made to discourage production of more horses, rather the reverse, for there is increasing demand for draft horses. We are compelled to admit further that the price is somewhat lower than a year ago, the average being $6.00 per head lower. This may be due to adverse financial conditions more than to overproduction.

PAYING THE COST

The department of agriculture has now secured through the signing of the deficiency act a sum of $2,500,000 to be used for compensation, or rather part compensation, of live stock breeders whose herds have been destroyed because of foot and mouth disease. It is to be hoped that the various states will come through with an equal amount. The compensation is little enough considering the great loss.

MORE PROSPERITY

On page 158 is some interesting reading. We are not referring to the markets but to the table under the heading "Weather Conditions." Every section of California was visited during the last week by a plentiful supply of moisture. Eureka, which is usually long on rainfall, shows the lightest of any section in the state, but its total for the season leads all others, so we need not worry over Eureka. San Luis Obispo tops the list with over five inches; Los Angeles comes next with nearly five, Red Bluff shows a total of over four, and San Diego outdoes herself with practically two and a half, or a total for the entire season of nearly nine inches, which is almost four inches above normal. We have promise of a wonderful showing of golden poppies for our visitors this year who will come to see the great expositions. Better, we have promise of golden dollars for the pockets of California producers.

FARMERS ORGANIZE

The meeting called by State Commissioner Cook and his committee appointed at the last State Fruit Growers' Convention, to be held in San Francisco February 22, should prove a great opportunity for the producers of the state to discuss the advisability of a general organization of the farming interests of the state. The recommendation of the committee which will be given to the gathering calls for a most ambitious organization. Perhaps its greatest activity is contemplated along scientific lines, but such an organization cannot well be held together without also accomplishing great good along economic lines. There are now in this state a great many organizations looking after the interests of the different branches of farming. The State Fruit Growers' Convention which has met annually for many years has looked after the interests of the fruit grower in a larger way though it has been devoid of definite organization, being a loose gathering of people brought together upon the call of the state horticultural commissioner. Draft horse breeders have had a strong organization. The same is true of the swine breeders, of the dairymen, of the live stock people in general. The wool growers have also had an organization; the grape producers another.

Is there not opportunity for these diverse interests, while still maintaining their associations to watch their own individual interests, gather greater power by affiliating under one general management and thus give to the producing classes an influence which they do not now have?

The meeting will be held at the Inside Inn on the Panama-Pacific Exposition grounds on Monday, February 22. The exposition will open on Saturday, the 20th, and Monday being a legal holiday should give opportunity to many people to go to San Francisco and take a first look at the great exposition and talk over the interests of the farmers for a short time.

Agricultural Notes

Colorado now has eight county agents at work in the field.

English railways are encouraging culture of sugar beets in their territory.

It is reported that the Italian government has just closed an order for 400,000 sacks of Michigan white beans.

The sweet potato is the principal article of food among the people of the West India islands. It is a native of the tropics.

Of breadstuffs the United States exported during 1914 $300,309,550 worth. This was an increase of over $100,000,000 from the previous year.

In peat lands of both Germany and England central electric stations have been established to utilize energy generated by burning peat for electric power.

There is a growing demand in Brazil for flower and garden seeds, the bulk of which have been imported from France, Germany, Portugal, Spain, and other European countries, the United States supplying only a small part.

A soap manufacturer of Argentina has been sucessfully experimenting with the manufacture of oil from grape seed. It is estimated that a refined article can be produced suitable for table use as well as the inferior used in soap making.

The Iowa Beef Producers' Association is planning its showing at the Panama-Pacific Exposition. It is stated that it expects to send from Iowa 200 head of cattle, at least 200 hogs, as many sheep, and about 200 horses.

It has been estimated that last week grain in cars at New York and Jersey City terminals awaiting trans-Atlantic shipment amounted to more than 7,000 carloads, and one railroad line is said to have 3,000 cars awaiting vessels at Baltimore.

The Southern Pacific, the Atchison Topeka & Santa Fe and the Western Pacific have notified the California Railroad Commission that they will abolish all switching charges on cars delivered from or taken to industry tracks, when incidental to a line haul.

Agricultural papers all over the country, as well as many other papers, are insisting that school houses should be working longer hours; not to keep the children longer at their studies, but to provide a community gathering place in the evenings.

The principal vegetable seeds imported at Rio de Janeiro are watercress, cabbage and lettuce, onions cauliflower, cabbage of all kinds spinach, peas, beans, melons, mustard turnips, Spanish black radishes, red radishes, small and large tomatoes etc. The varieties of flowers most popular include carnations (mixed) pansies, zinnias, violets, chrysanthemums, flowering vines, etc. Planting is commenced in March.

"Kamiko," as paper clothing is called in Japan, is made of the real Japanese paper manufactured from mulberry bark. The paper has little "size" in it and, though soft and warm, a thin layer of silk wadding is placed between two sheets of the paper and the whole is quilted. Velvet shirts and drawers made in this way are more comfortable than flannels. The Japanese soldiers realized the value of this kind of clothing when they had to weather a Siberian winter. A company in Yokohama is supplying large quantities of paper shirts to the Russian army.

Agricultural News Notes of the Pacific Coast

Northern California

Bean men of Sutter County are planting large acreage.

The citrus products plant at Lodi is nearly ready for its initial operation.

Tehama County's olive production is running heavier than any preceding year.

Another seedless lemon has been developed at Fairoaks, Sacramento County.

Dairymen near Arcata, Humboldt County, are forming a cow-testing association.

Consumers of domestic water of Sacramento are objecting seriously to its quality.

Napa County dairymen are considering the advisability of forming a cow testing association.

Dixon, Solano County, farmers are discussing advisability of mutton production on the small farm.

The newly formed cow testing association known as Sacramento-Yolo Association has over 900 cows signed up.

The board of directors of the Napa County farm bureau met and discussed matters pertaining to the next county fair.

The Haywards Poultry Producers' Association recently met in monthly meeting. Over 150 poultry breeders attended.

T. E. Quissenberry of the Missouri state experiment station has been made superintendent of the poultry division at the Panama-Pacific Exposition.

The largest shipment of rice ever made from this state went out from Sacramento late in January. It consisted of over 40 cars, with 1,600,000 pounds.

An olive grower at Corning, Tehama County, is developing a process by which ripe olives may be cured or fried. The bitterness is extracted during the process and the dried product is said to be delicious.

The rice crops grown on the west side of the Sacramento Valley this season made very satisfactory yields in spite of the fact that they were all planted too late. Yields of over 40 sacks per acre are reported.

The litigation between the Kuhn syndicate, or the Sacramento Valley Irrigation Company, and Beckwith and other interests, has been adjusted and the judgment which was granted to Byron D. Beckwith of Colusa has been settled for $87,000.

A few outbreaks of hog cholera are reported in the Sacramento Valley. Both the University of California and the United States department of agriculture have men in the field giving lectures and demonstrations on the use of hog cholera serum and virus, and many growers are successfully using the treatments.

The run of grain stubble hogs from the Sacramento Valley and the San Joaquin country is about over, and the bulk of the pork of California is coming from southern Idaho by way of Ogden. Hogs are plentiful in Idaho, and it may be some time before there is any marked increase in prices in California markets.

Central California

Monterey claims to have run the first jitney bus in the state.

California's per acre yield of rice for 1914 averaged 53.3 bushels.

Grape growers expect to benefit by the war between shook manufacturers.

The old Chatten ranch of Tulare County has been placed on the market for subdivision.

Citrus fruit growers of Tulare have organized an association to find means of utilizing culls.

One thousand two hundred and eighty acres are to be planted to rice near Wasco, Kern County.

Demonstrations in vineyard pruning are being given in various sections of Fresno County by Mr. Frank Henry.

Two bills have been introduced into the assembly for regulation of sale and shipment of frost-bitten and immature citrus fruits.

Dates for the next show of the Porterville Poultry and Pet Stock Association have been set for December 2, 3, 4, and 5.

Shipments of citrus fruit from Tulare county this season have been nearly 1,000 cars heavier than last year at this time.

A Modesto rancher is suing the Turlock irrigation district for $30,000 damages because of the water flowing across his ranch when the Davis reservoir broke last year.

Beekeepers of Stanislaus County met at the county seat Saturday, January 30, to discuss the exhibit of the California Beekeepers' Association at the Panama-Pacific.

The San Joaquin Valley Counties' Association has made its last shipment of exhibit products for the Panama-Pacific. Practically everything is now ready for the opening day.

The supervisors of Kings County have ordered submission of bids for bridges whose construction will connect up the various sections of state highway already completed in Kings County.

Veterinarians from the state university are making investigations and giving interesting information to hog breeders in various portions of the valley as to care of hogs and prevention of disease.

At the recent annual meeting of the Visalia Cooperative Creamery over 300 stockholders were present. The secretary's report showed a return of 20 per cent on investment of stockholders during the past year. Former directors were reelected.

Commissioner of Corporations H. L. Carnahan, newly appointed by the governor, has announced that he will maintain offices in Sacramento and Los Angeles for the administration of the blue sky law, and possibly later will open an office in San Francisco.

The grazing permits to be issued to stockmen for grazing on public lands of California for 1915 will aggregate nearly a million meat animals. There will be 212,000 cattle and horses, 505,750 sheep, 8000 swine. This is a material increase over number of permits issued in 1914.

Southern California

The biggest crop in the Imperial Valley is alfalfa, of which there is now planted 128,148 acres.

A company has been incorporated in the Imperial Valley to manufacture serum for hog cholera.

Sixty carloads of beans were shipped from one warehouse in Saticoy, Ventura County, during January.

The Mound Farmers' Club of Ventura County is working to secure a branch of the county free library.

The Moorpark farm bureau is discussing advisability of forming a walnut association in the Simi Valley.

The Villa Park Orange Association, Orange County, opened its packing house for the coming season on January 20.

The Arlington Poultry Association has endorsed the plan followed by the Federated Poultry Club of Los Angeles.

A Ventura County bean grower received last week from the Italian government an order for 20,000 sacks of pink beans.

Several towns in the San Gabriel Valley of Los Angeles County are making an effort to secure a regular agricultural fair.

Several Southern California towns are planning to extend the glad hand to the Western Fruit Jobbers who will visit the state early in February.

The Celery Growers' Association during January shipped out 47 carloads. The manager of the association reports the present market as fair.

The Covina Valley farmers' club met in Irwindale last Saturday and listened to an address by President Monroe of the local Citrus By-Products Company.

Land owners in the Palo Verde and Coachella Valley sections are appealing for a United States land office to be established on the Colorado desert.

Three cars of celery are now being shipped daily by the Celery Growers' Association from the Smeltzer, Wintersburg and Talbert stations in Orange County.

Ventura County proposes to make its county fair a permanent institution. The fair association is to be organized February 6 at the chamber of commerce rooms in the court house.

Suits are still being prosecuted in San Bernardino and Riverside Counties by orange growers against cement works because of estimated damages to vegetation from dust from the mills.

The coming citrus fruit crop is estimated to run close to 38,000 carloads, though some estimates place it at 40,000. This does not include the 5500 carloads to be shipped from north of Tehachapi.

Forest Supervisor Charlton after several years of effort has at last succeeded in interesting goat owners in the subject of feeding out his firebreaks, and the secretary of agriculture has just authorized the free grazing of 4000 of these animals as well as the payment of an additional bonus for handling them according to a definite agreement.

The Coast

The poultry show at Chandler, Arizona, closed last week.

Oregon's dairy production during the year ending October, 1913, amounted to nearly $19,000,000.

Advance in freight rates from Portland, Oregon, has caused almost complete stoppage in exports.

Improvements in a large meat packing plant at Spokane are under way which will cost over $50,000.

"More livestock as a by-product" is the slogan of many farmers of Washington, Oregon and Northern Idaho.

The Chandler Poultry Association of Chandler, Arizona, is holding its annual show. Over 60 prizes are offered.

A general institute was held at Logan, Utah, recently in which teachers, housekeepers and farmers united.

Eastern Washington, often known as the Inland Empire, is moving for state division, with Spokane as its capital.

Some damage by extreme cold and lack of snow has been done to wheat in the neighborhood of Walla Walla, Washington.

The Montana state college of agriculture at Bozeman held a Farmers' Week and Country Life convention the last week of January.

The state hop-growers' association met at Hillsboro, Oregon, last week at which time $5000 in additional shares was subscribed.

The Carnation Stock Farm, near Seattle, Washington, has just purchased for $25,000 the prize Holstein bull, Johanna McKinley Segis.

Experts from the University of Washington at Pullman are visiting hog-producing sections and giving information as to best methods.

A meeting of cantaloupe growers was held at Chandler, Arizona, recently and plans were formulated for next season's planting and marketing.

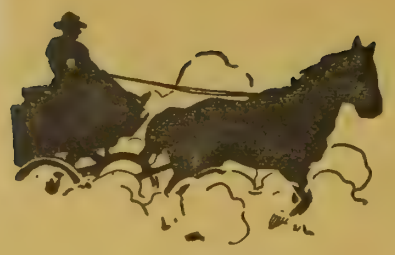
Montana produced $4,500,000 worth of dairy products during the year, according to the annual report of State Dairy Commissioner A. G. Scholes.

Cantaloupe buyers have been in the Chandler, Arizona, section for some time endeavoring to sign up at least 200 acres of contracts. An advance of $5 per acre was offered.

An organization known as the East Chandler Water Users' Association has been formed for the purpose of reclaiming thousands of acres near Chandler, Arizona. H. C. Meyer was elected president and Gus Tyler secretary.

During farmers' week at the Oregon Agricultural College at Corvallis the first week of February four dairy associations will hold meetings. They are: Oregon Milk Dealers' Association, Oregon Jersey Cattle Club, Oregon Holstein-Friesian Association and Oregon State Dairymen's Association.

Fruit growers representing over 15,000 cars or apples met in Seattle recently and discussed marketing, especially the handling of cull products. Many packers of the Northwest have signed an agreement with growers recognizing the association and agreeing to abide by the rulings of its governing board.



Sweat and dust are two of leather's worst enemies. One eats the leather fibre while the other cuts it with every movement the horses make.

EUREKA HARNESS OIL

saves the life of your harness. Leather is fairly honey-combed with pores. Eureka fills them, keeping out dust, sweat and moisture. It keeps your harness *new*. An occasional application does the business—an easy task, but one that saves you the cost of many a good set of harness. Dealers everywhere.

Live Stock and Dairy

TRAIN HOGS TO COME WHEN YOU CALL

Written for California Cultivator
By Sacramento Valley Contributor

AT this time of the year many good farmers have their places so arranged that the hogs have "the run of the place," and they not only get most of their living but spend all of their time in the field.

And while they may not require attention and do not need more feed than they are getting, it is a good practice to see them every day, and there is no better way to do that than to train them to come up to the buildings every night when they are called. This can easily be done by having water and the salt, ashes and lime trough in some handy place and feeding a little of some kind of grain. Even though the hogs are "full as they can stick" they will come up for this little bite, and when the feeder calls "poo-ee-ii-g!" they can be seen coming from all over the farm.

Close by this central feeding place it is a good plan to have a shed for them to sleep in so that they may "make their headquarters" as it were, where the owner knows where they are.

All kinds of animals can be trained to come up for feed. They may have to be driven in a few times, but after they understand the proceeding they will come regularly. They must always be fed, however, and never "fooled."

This practice of "calling in" sheep and goats and feeding them a little something every day is sometimes practiced by wise stockmen who range stock in rocky, mountainous country where to "round up" and see stock frequently is an impossibility because of the roughness of the country.

It may be suggested that on a big farm this bringing in of the hogs every night would cause them to "run off" too much flesh, but it is found that the young and old sows and growing pigs benefit greatly from the exercise and hogs ready for market or nearly finished are generally in close pens anyway.

And another thing may be said in favor of this practice, that when you hear a farmer making the long drawn out sort of yodeling cry "poo-ee-i-g!" the chances are 100 to 1 that he is a good farmer an a good hog man. So it is worth something to be in the "hog calling" class.

WORKING TO AN IDEAL IN A DAIRY HERD

(Continued from Page 131)

Koningen Korndyke, a son of Lorena Korndyke and out of Dorothy Koningen Spofford who has a seven-day record of 22.18 pounds of butter and 500.8 pounds of milk.

There is nothing fancy nor spectacular about Mr. Guill's methods. The impression received on visiting the ranch and talking with the proprietor is that things are done on strictly business principles with a view to making the utmost use of every resource. There is a good, new, and up-to-date milking barn, but the other buildings are those that have seen service on a regular California grain and stock ranch. There are two or three silos that have seen much service and have survived the fire which destroyed the original milking barn a few years ago. The silos are filled with corn each fall and are a guarantee that the cows have the best of feed. Plenty of alfalfa hay is produced and there is a good range of upland pasture for spring and early summer.

A few figures of daily milk yield of the herd are of interest. During the year 1913 the highest number of cows milked was 26 and the smallest number 16. The average number for the year was 21, four being heifers with first calf. Three daily weights are here given, two of them accompanied by a butter fat test.

1913—February 10, 19 cows, 472 pounds of milk; 16.66 pounds fat. March 7, 22 cows, 673 pounds milk; 22.46 pounds fat. June 4, 25 cows, 897.5 pounds milk.

On February 10 the average fat test was 3.5 per cent and on March 7, 3. 3 per cent.

Between 1913 and 1914 there was a good deal of culling out done in the herd for the record for 1914 shows 12 heifers present with the first calf, or an equivalent of half the herd. Still the yield per head was equal to that in 1913.

1914—April 3, 25 cows; 804 pounds milk. June 10, 25 cows; 841 pounds milk. October 6, 25 cows; 500 pounds milk.

By October the herd averaged seven months in milk, that is since coming fresh.

The financial returns of any ranch are always of interest, and Mr. Guill has kindly given me the figures for his herd during 1913 and 1914. The dairy product is sold to a creamery in Chico in three forms, sweet milk and sweet cream for household trade or ice cream and cream for butter making. The returns for the two years are as follows:

1913

	Sweet Cream	Cream for Butter-Making	Total
Jan.	$ 55.60	$117.95	$ 173.55
Feb.	51.40	103.21	154.61
March	94.65	137.50	232.15
April	118.30	111.55	229.85
May	200.20	90.35	290.55
June	246.75	58.85	305.60
July	330.50	65.90	396.40
Aug.	238.45	99.75	338.20

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powder-paint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer 163 North St., Adams, N. Y., and he will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write today.

average number of cows, 23; average income per cow, $12.30.

Mr. Guill is fortunate in having a market for so much of his product as sweet cream. In that form butter fat rules considerably higher than the same cream for butter making. But aside from market conditions, Mr. Guill is not more favorably situated than hundreds of dairymen. He is winning in the dairy race by having a high ideal of what a dairy cow should look like and what she should produce. The two illustrations show something of what this ideal is worth. The "business end" of those beautiful cows shows that they can give a good account of their stewardship at the milk pail. The calves are built right and the cow man can see the future milker in them now. I am not sure that there is a registered cow on the ranch. If there is, her glories are not above the glory of the herd, which has been built up on the ordinary foundation by the use of registered bulls. It is one of the best illustrations of a graded up herd I have seen in California.

FARROWING TIME

Written for California Cultivator
By Sacramento Valley Contributor

When the inhabitants of the Middle West and Eastern states are suffering from zero cold and blizzards, we in California are apt to have rains, and with the rain, days of chilly weather that make young pigs and young calves shiver with the cold.

These are the times when the careful, watchful stockman makes money and his more careless neighbor loses. Many a litter of good pigs has become chilled, and all or a part lost because there was no one to see that there was a dry bed and that the little pigs secured a feed of warm milk within a few hours after birth.

It is remarkable what a young animal will stand in the way of cold and exposure if its stomach is full of hot, rich, mother's milk. A young pig or calf is a delicate thing as it comes into the world, but because of the vicissitudes it is liable to encounter it is endowed with a vast store of vitality—comparatively—and if it gets the start that it is intended by nature that the mother's first milk will give it, the youngster is well started toward a successful and useful career.

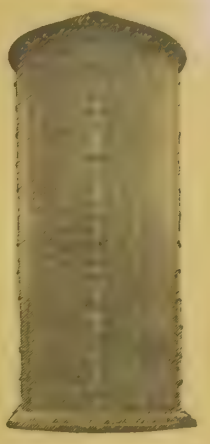
One Sacramento Valley stockman has a lot of young sows that are having pigs and due to farrow now, and for the past month there has been considerable rain and many raw days. Like every other busy farmer there are many jobs on the farm that engage his attention. One day recently he came in from the field and found a sow with six pigs. They were all huddled together in a bunch, and supposing that they were all right he went to work doing up the chores.

In a couple of hours he went back and found two of the pigs up and sucking—and the other four sprawled out in the cold. Evidently they had not sucked yet and they did not have energy and ambition enough to try. They were wrapped up in a sack, taken into the house, put into the oven (with the door left open), thoroughly warmed up and given one or two teaspoons of warm cow's milk, then taken out to the sow. Had this been done soon enough, or if some one had seen to it that they had gotten some of their mother's milk they would undoubtedly have been

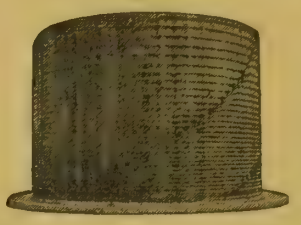
SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS

16 x 36 Redwood Stave Silo manuafactured by us for the Panama-Pacific International Exposition, San Francisco, 1915



TANKS



Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.

SUDAN GRASS CROP ON E. J. COWART FARM NEAR LUBBOCK

Buy Your $udan Grass $eed Now

¶ There will be a shortage of PURE Sudan Grass Seed before sowing time comes. Now is the time to order if you want pure, reliable, genuine seed. Later on you'll have to take your choice between paying top prices to speculators or taking greatly inferior quality — adulterated, rejected seed mixtures, sold without a guarantee, that will spoil your crop and ruin your land.

¶ Don't take our word for it. The leading authorities on Sudan Grass in the country are expressing the same opinion about the quantity of seed available this year.

¶ Mr. B. Youngblood, Director, Texas Experiment Stations, makes the following statement:

"I am inclined to think that the Texas farmers who intend to buy seed, should do so now, rather than next spring, when seed speculators will in all probability run the price clear out of reach."

¶ Mr. A. B. Connor, Agronomist, Texas Experiment Stations, writes:

"The present acreage will scarcely supply the needs of the Texas farmers."

¶ That defines the situation in Texas, where according to the United States Department of Agriculture's News Letter of October 14, 1914: "Probably fifty per cent of the total amount of seed will be produced this year."

¶ As long as our supply lasts our prices will remain the same and every pound of our seed is absolutely guaranteed to possess full germinating power and to be free from Johnson Grass or any adulterant. It has been grown under the supervision of Texas Substation No. 8, located in Lubbock County, V. L. Cory, Superintendent, and every field was officially inspected, certified to and passed before harvesting.

WARNING! We are the only authorized agents for selling Lubbock Association Guaranteed Seed. Be sure that all seed you buy has our name and trade-mark stamped on every bag. Ask your dealer for Lubbock Sudan Grass Seed Association PURE SEED.

BETTER CREAM BETTER BUTTER BETTER PRICES

The Ideal Sanitary Cream Cooler

Will remove the animal heat from the cream while flowing from the separator, and as well reduce the temperature sufficiently low that it can be at once mixed with older cream and set aside for future delivery without further cooling.

Its cooling capacity is sufficient that where used in connection with the largest hand-power separator, it is capable of reducing the temperature to within three to four degrees of the water used.

It is so constructed that it can be placed under the cream spout of the smallest size separator and still be high enough to deliver by gravity into a 5 or 10-gallon can. Write for Cooler Circular.

saved, as it was they were too far gone and the four died. The other two are all right.

Now someone will read this who will say that this is all nonsense and that all that is necessary in order to have success with hogs is to let the sows alone, that they can take care of themselves and their pigs better without than with help.

The answer to this is that in many, many cases this last statement is true, but that the exception is that every hog, like every man or any other living thing, is both like and unlike every other, and different individuals require different treatment.

This is well illustrated by experience during the past month in the herd referred to. One sow had the experience related, another young sow farrowed seven fine, husky pigs, is raising them all and they are making splendid growth. They neither had nor required any attention. Another sow had trouble in farrowing—and if one pig had not been taken away from her she would have died from blood poisoning. All are young sows from the same herd, of the same breeding, and they have all had the same good care. They have had alfalfa pasture, plenty of exercise and enough corn, barley, oil meal, etc., to grow them well and keep them in the "pink" of condition.

All of which goes to prove that the man who makes the biggest success and the most money in the stock business—opportunity and capital invested considered—is the one who is the best caretaker and who combines common sense with a genuine love for live stock. All are indispensable and particularly the latter.

USE TWO INCHES OF SILAGE A DAY

To have silage that is in the best condition, you must use about two inches of it from your silo every day, according to J. B. Fitch of the dairy department of the Kansas Agricultural College.

The size of silo to construct will therefore depend upon the number of animals to be fed. As a general rule, the height of a silo should be at least twice the diameter. If a silo is made tall the pressure will be great, which helps insure good keeping of the silage. When silage is exposed to the air for any length of time it will spoil, hence it is poor policy to make your silo so large that you cannot use a layer of silage at least two inches deep, every day. Under ordinary conditions a cow will eat 30 or 40 pounds of silage a day. By figuring from this it is not difficult to decide what size of silo is needed for the number of animals to be fed.

Profit From the Silo

A farmer who has only four or five cows may, perhaps, not be justified in building an expensive silo, Mr. Fitch believes, but the man who is feeding a number of cattle cannot invest money to better advantage. According to a report of the federal department of agriculture, the cost of silage will average about $2.50 a ton, allowance having been made for all factors of expense except depreciation in soil fertility. While the feeding value of silage is difficult to determine accurately, it should at the present time, when fed with good judgment to beef or dairy cattle, be $3.50 a ton.

Care should be taken, in preparing to build a silo, to decide upon one that will prove satisfactory in the long run.

Culti-Pack Your Soil

Your crops will get a be ter start and have a stronger, healthier root if you prepare your seed bed with

THE DUNHAM CULTI-PACKER

There are two rows of "V" shaped wheels that work down deep in the soil, crushing every lump and stirring the top like a cultivator.

Loose, ashy or sandy soils are made firm and compact so that moisture will gather, and give seed a good start. The top is stirred and mulched to keep the moisture from evaporating.

When the crop is in, you do not put the Culti-Packer away, but use it first on the new seeded field, then on the growing wheat, corn or oats, until the plants are three or four inches high. It firms the soil around the roots, breaks up crusts and makes a strong, sturdy plant. It will straddle corn rows, hinder the young weeds and save one cultivation.

The Culti-Packer is built to last; frames are heavy steel and castings semi-steel; like all Dunham machines it is fitted with the famous Dunham Roller Bearings which make it run easily.

Culti-Packers in stock in every state.

Guarantee. The Culti-Packer is guaranteed to pack, stir, level, roll and pulverize the soil in one operation better than any other implement on the market.

HOLSTEIN CATTLE

British Holstein butter gained highest honors at the last dairy show of the Royal Dublin Society in Ireland. In addition to taking the prizes in special classes, this butter won for its producers a gold medal awarded for the best butter in the show. It is sometimes ignorantly asserted that the Holstein is a poor butter cow, in the face of the fact that the world's record for butter production for all periods of official testing (except the 365 day) are held by purebred registered Holstein cows, and the year's record was exceeded by only one cow of another herd.

SWEETER CREAM—HIGHER PRICES

One of the most serious problems with which dairymen have to contend is that of delivering sweet, well flavored cream. The sterilizing of utensils and care of cream in sultry weather require constant vigilance. people on earth to whom time is money it is the dairymen. We were recently shown an aerator and cooler so constructed that when placed under the cream spout of the smallest separator it will still be high enough to deliver cream into the ordinary sized ten-gallon cream can. An illustration

AERATING CREAM AS IT COMES FROM SEPARATOR

Where a dairy is fitted with satisfactory aerators the problem is to a certain extent simplified, but the arrangement of most dairies makes it almost impossible to aerate cream as it comes from the separator without repeated handling. This takes time, and consequently money, and if there is a of the cooler is given on this page. The separator is not shown in the engraving, or at least only a portion of it, but it will be noted that the delivery from the separator places the cream through the opening in the cover of the aerator. From this point it is carried to the center of the cooler and if the appliance is properly levelled it will flow freely over the cooling surface and be delivered into the cream can, not only aerated but reduced to the temperature of the water which is flowing underneath the surface over which the cream passes. The small hose attached to the cooler delivers the water while the larger carries away the waste. This cooler will remove the animal heat from the cream while flowing from the separator and as well reduce the temperature sufficiently low that it can be at once mixed with older cream and set aside for future delivery without further cooling.

The two large openings in the top of the cover of the aerator are supplied with finely perforated covering which gives sufficient pure air.

The best buttermaker in the world cannot make sweet butter from off-flavored cream. It is to be hoped the simplicity and economy of this cooler will induce dairymen to secure it unless already supplied with a similarly satisfactory working appliance.

A MARINE VIEW

Driven to it by stern necessity, the old sailor had taken the job of running an elevator.

"'Vast there, my hearty!" he said to the fat man who was stepping toward the side of the car, "I'll have to ask ye to stand amidships. This craft has a heavy list to port."

Poultry for Profit

SOME PRACTICAL EXPERIENCES WITH POULTRY

Written for the California Cultivator
By Mary E. Edwards

THIS is an account of what one woman has done the past year in helping to solve the problem of how to live and make both ends meet on a limited income. No pretense is made that the writer of this little story possesses any smartness about the details of the poultry business, or, indeed, anything more than common sense and patience. Now if the many readers of the California Cultivator are willing to read what one with such qualifications has to say, in a small way, about poultry and the profit there may be in it, then it may be worth while to read on to the end of my experience as herein set forth. Remember this is the story of one of the unimportant producers in the business to "help out" expenses.

Several years ago I began with a half dozen laying hens, from which little flock the next year there were raised about two dozen pullets which made the flock of laying hens nearly three dozen. These were Brown Leghorns and Black Minorcas. Up to this time the family used the most of the egg production. Indeed that was about the only idea I had of keeping chickens—an aid to the table. During this time I sold several dozen eggs at such a good price that I became affected, like many others no doubt, before whose vision there appeared the possibilities of doing so much with so little responsiblty. But, dear reader, don't hurry away with this idea that there is "so little responsibility." I have learned, in my small way, that there is a great deal of responsibility in caring for chickens, if you get any profit in return for your labor.

I purchased several settings of eggs from neighbors for early spring hatching and used some of my own hens' eggs, always selecting the largest and best formed, and they were carefully handled and wrapped before being used. In selecting hens for mothers those showing the quietest and best dispositions were chosen. My chicks were all mothered by old hens. Then when the present season began with the month of January, my flock of layers numbered between 80 and 90. The flock was housed in the usual small houses with slanting roofs and open fronts, without floors. These houses were inclosed within a small corral where the chickens were kept during the night. In the daytime the flock ranged about a small lemon grove. At times they found some food about the place, but not much. There is some question aobut the advantage of such a range. So far as feed is concerned there is little to be had at any time on the usual orange or lemon ranch. But there is some advantage in the ranging and scratching exercise. This may help to keep hens healthy.

The following statement shows what were my expenses and returns monthly during the laying season from January to September:

January			
Cash received for eggs	$14.59		
Family use	4.20		
	$18.79		
Cash expenses		$ 9.30	$ 9.49
February			
Cash received eggs and poultry	$15.11		
Fam'ly use	3.50		
	$18.61		
Cash expense		7.50	11.11
March			
Cash received eggs	$ 9.15		
Family use and setting eggs	4.70		
Family use	4.70		
	$13.85		
Cash expense		10.65	3.20
April			
Cash received eggs and poultry	$25.80		
Family use and setting eggs	3.42		
	$29.27		
Cash expense		5.50	23.77
May			
Cash received eggs and poultry	$30.50		
Family use and setting eggs	3.96		
	$34.46		
Cash expense		$ 9.25	$25.21
June			
Cash received eggs $20.89, broilers $8.86	$29.75		
Family use	2.64		
	$32.39		
Cash expense		$ 8.15	$24.24
July			
Cash received eggs	$16.60		
Family use	1.63		
	$18.23		
Cash expense		$10.40	$ 7.83
August			
Cash received eggs	$32.02		
Family use	1.50		
	$33.52		
Cash expense		$ 6.30	$27.22
September			
Cash received eggs and poultry	$11.36		
Family use	2.80		
	$14.16		
Cash expense		$ 7.99	$ 6.17

Of the months October, November and December it may be sufficient to say that the flock will hardly produce enough to pay for its keep. This income from the flock for the three months would be a few eggs and poultry for family use. My flock now numbers 125, of which 50 are hens and balance pullets. Besides I have about 25 nondescripts being fed for market.

An item of feeding not counted as expense in the above figures would be green alfalfa which the flock had in plenty throughout the year. The alfalfa was chopped fine before feeding and no doubt helped largely in keeping down the expense account. Besides the flock ranged at large much of the time.

So you see from the above statement that I have contributed something each month towards solving the difficult problem of modern living expenses. Above my actual outlay I

have received $138.24. Perhaps all of this should not be called profit in the strict sense of the term since time is worth something in any figuring. But it is a nice return to me for the time given to my flock and the help to the table expense. Besides my capital has increased with my flock from less than 100 to 125, with all culling out of this number. I have about 125 dependable layers for the coming season and 25 culls for market. My stock is now made up of Rhode Island Reds, Black Minorcas and Barred Rocks. These with Leghorns are best for egg producing, I think.

Now all this may not be so interesting to others as it seems to me. But it is my personal experience, without much knowledge of chickens at the start, I have used patience in handling my flock and have at all times kept them clean and free from disease. Maybe my account of experience with poultry does not add very much to the common store of knowledge of the industry, but it may prove of help to some women who want to help in solving the question how to live and make both ends meet in these exciting times.

HOW TO PREVENT ROUP

An ounce of prevention is worth a pound of cure.

It's the old, old story and it applies to poultry diseases as well as to other disorders.

"Prevention," says John B. Hayes, of the poultry department of the University of Wisconsin, "is the most satisfactory method of treating roup." This troublesome disease he has found can be prevented in these ways:

By keeping the house dry, well ventilated and clean; by making the fowls exercise on cold, wet days in the house in a deep litter of straw; by breeding from strong, vigorous birds; by feeding clean, wholesome feeds, and by taking every precaution to prevent the introduction of the disease into the flock.

If in spite of these precautions the disease does appear, Mr. Hayes recommends that the poultryman make up a strong solution of permanganate of potash and then each day pour enough of this into the drinking water to give it a violet or wine color.

Many of the birds which have developed roup or exceedingly bad colds should be removed from the house and the houses disinfected with coal tar disinfectant or a five per cent solution of carbolic acid. Unless the birds are valuable it is advisable to kill and burn or bury all sick fowls.

With all birds worth the time necessary to give them individual treatment the following will likely prove successful:

Thoroughly clean the nostril and eye of all the cheesy material that has collected. Inject into the nostril with a syringe a saturated solution of permanganate of potash and dust boric acid into the eye and nostril. This treatment must be followed several times a day until decided improvement is noticed when the permanganate of potash can be omitted. The boric acid should be continued until the nostrils are dry and all enlargement of the eye has disappeared. It is not advisable for most people to attempt to remove the mass that collects beneath the eye by an operation and if taken in time the other treatment will prove effective.

See that the turkeys are encouraged to come home at night by making it a point to feed them every evening. If there is any danger of the neighbors' flocks running together, put a dab of bright colored paint on your birds' wings, where it can be readily seen.

It is a great temptation to feed hot mashes in cold weather. They will be eaten with relish by the hens, but in the end will only work harm, under ordinary conditions. It heats the hens temporarily and opens the pores of the skin. When the warming effect has passed, the hens feel the cold more than ever, and are in condition to catch cold. Roup and catarrh follow.

Don't wait till the last day before you halter-break the cattle you are going to take to the fair. If you do, you may have a circus, as well as a fair.

Keep a good, deep, dry bed under the horse while he is in the stable, day or night, on Sundays especially. The more he lies down, the longer his legs and feet will last.

The Fresh Air Brooder Stove

It exhausts warm **Fresh Air** from its **Base** to the chicks. If you use our stove you can't get away from proper **ventilation. The Cultivator Book

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of California

Contributor to columns of California Cultivator with years of actual experience in breeding and experimenting with poultry.

Copy for book has been read by experts who pronounce it one of the most practical along poultry lines yet published. It calls particular attention to many difficulties that confront the amateur and experienced poultryman, and points out clearly simple methods of avoiding and overcoming them.

The book is 5½x8 inches and contains 12 chapters, with over 200 pages of text and 50 illustrations, printed on egg-shell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

My Mistake

In the Cultivator of January 31, on page 82, under the heading "Faulty Eyesight," my reply to the question would have better suited a case of opthalmia such as is common east of the Rocky Mountains, where I spent several years at my profession. I might have added that I had known a man who had a very dark stable who had several horses act just as did those described in the question, and some of them had lost their eyesight entirely. He was advised to put large windows in his stable, which he did, and had no more trouble with his horses' eyes. No doubt the direct cause of the trouble with the horses at Inyo-Kern was loco poisoning, and the faulty eyesight was only one of the symptoms.

It has been said that it is only a true friend who will tell one of his faults, and I believe it. I fully appreciate the kindness of the three gentlemen, whose letters regarding this question were in last week's Cultivator, for writing in to set me right, and I take this opportunity to thank them for doing so.

It has always been understood that a horse once "locoed" was never right after that. All kinds of remedies have been tried but so far none have been found that will cure.—William Petrie.

Fox Tail

My horse had a fox tail in his throat which caused a swelling between the jaw bones. Had it lanced and can keep the swelling down, but it still runs. It has been two months since it was lanced.—Subscriber, Terra Bella.

There may be something still in the cavity with the pus that is keeping up the irritation and will not let it heal. You had better get someone who understands such work to make the opening large enough to examine it to the bottom and scrape the inside of the cavity. After that it should heal quickly.

Lameness

Colt eight months old is lame in hind leg. Can walk all right but cannot trot or lope on it. When loping it will hop and carry that foot. There is no sign of troube anywhere and there is no soreness when pressing on it. She rests that leg most of the time. —Subscriber, El Centro.

The lameness may be caused by rheumatism or it might be a spavin that has not developed enough yet to show on the surface. We suggest that you give the following treatment for rheumatism and also bathe the hip with liniment. Take of nitrate of potash two ounces, salicylate of soda one ounce and bicarbonate of soda one ounce. Mix and divide into 16 powders. Give one powder each day. A good liniment for the hip can be made of spirits turpentine, spirits camphor, tincture of arnica, oil origanum, aqua ammonia and alcohol; of each one ounce and enough water to make one pint. Shake and apply once a day.

In grazing over land sheep add greatly to its fertility.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

For Sale—10-months-old Toggenberg doe, dam, Lady Barbara No. 282, sire Brutus No. 486. For particulars, address C. E. Forsythe, 701 So. Grand Ave., Pasadena, Cal.

For Sale—Young registered Berkshire boars and sows; fine, strong stock. Boars ready for service—January. Stanislaus Ranch Co., Crows Landing, Cal.

Thoroughbred Berkshire Boars of all ages; two grade Holstein Bull Calves from seven gallon cows and registered bull; born Aug. 11, 1914, Jan. 10, 1915. $45, $20. Riccomi Bros., Mountain View, Cal.

For Sale—A few fine good Toggenberg Milch Goats; write for description and tell me what you want. C. H. Brown, Box 444, Chandler, Ariz.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

M. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

RABBITS

Caldwell's Royal Red New Zealands at L. A. show won 15 prizes, including two silver cups. Catalog on request. Caldwell Bros., Box 613 R, Los Angeles.

Anderson Flume Gates are especially adapted to modern up-to-date irrigating systems. Their construction permits of a finer adjustment, without clogging, than any other Gate made, and when closed they are **watertight.**

We make a specially adjusted Gate for pressure systems which is un-surpassed by any sheet metal Gate made, and being used in capped stands, no valves are needed. Send for descriptive circular today. Samples sent post-paid 10c.

ANDERSON FLUME GATE COMPANY

Manufacturers of High Grade Flume and Pressure Gates. Redlands, Cal. Phone Black 96.

Try this New Blackberry At Our Expense

TO CULTIVATOR SUBSCRIBERS ONLY—To have this New Macatawa Everbearing Blackberry tested in as many localities as possible, claiming it to be the sweetest and best table berry on the Coast, the propagators of this berry have made us a proposition for supplying same in shipments of 6 plants each by parcel post, all charges paid.

Their description of the Macatawa is as follows: "It is a cross between the true Giant Himalaya and the Eldorado. The fruit is very large and sweet, in fact, it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way by three and one-fourth inches the other way. The bloom is almost semi-double, about the size of a silver dollar. So far all who have tested this berry say it is the sweetest and best flavored berry they ever tried."

DO YOU WANT SIX OF THESE PLANTS? If so send in the regular subscription price for one year's subscription to the Cultivator, new or renewal; add 25c to cover cost to the nursery of postage and packing, and the six plants will be carefully packed and mailed you promptly without additional charge.

REMEMBER—The regular price of the 6 plants alone is $1.00 postpaid. Only one shipment will be made to a customer, but subscriptions and plants may be sent to different addresses.

Get Next To This Inside Stuff

There are thousands of men, pipe-stung and tongue-sore, who love a pipe, but have had to chuck it because the tobaccos they've tried have left their tongues as tender as though they'd been chewed. You fellows who have bitten at and been bitten by tobacco full of rough edges come on in and get next to the joy of smoking fragrant tobacco that's had its teeth pulled. The goodness of

PRINCE ALBERT

the national joy smoke

is all in the tobacco and the wonderful patented process that takes out the bite, leaving a cool, comfortable, free-burning, fluffy smoke that you can hit as hard and as often as you feel that impulse. Meanwhile Mr. Tongue lolls around as happy as a clam at high tide. When we say we control this patented process exclusively and that no one else can use it, we're handing you strictly inside stuff. There isn't another tobacco in the world just like good old P. A. There never can be.

So, if you've canned that good old jimmy pipe, get it out and give it a new lease of life.

You can buy P. A. at any store that sells tobacco, either in the tidy red tin, 10c; the toppy red bag, 5c; in pound and half-pound tin humidors; or in the crystal-glass P. A. humidor containing one pound, the dandiest kind of a container for home and office use.

R. J. REYNOLDS TOBACCO CO., Winston-Salem, N. C.

"Jackson MADE"

The greatest test of any pump is its ability to raise the maximum amount at lowest cost per gallon, day in and day out, year after year.

True pumping economy is one of the great features of "Jackson Made" pumps; they work economically and their freedom from repairs and power saving pays their original cost in a few months.

If your pumping puzzles you, tell us—our expert engineers are at your service free of charge.

Write for Catalog No. 48A

A Better Make Not Made

"Jackson Made" pumps are manufactured in various styles to do your particular work at lowest possible cost.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Rotation

What is a suitable rotation for the vicinity of Santa Cruz where sugar beets is to be the principal crop?—Subscriber, Ames, Iowa.

Beets, rye, either barley or corn, and beans would make an excellent rotation. If the soil is exceptionally rich it is possible, for a time at least, that the beets could be brought in twice in the four-year rotation, but for permanent results the four-year rotation is best.

Red Clover

When is the proper time to sow red clover seed and will it do well on low sandy soil? How many cuttings are there per year? Do bees do well on clover?—Subscriber, Watsonville.

We do not think it would do well on sandy soil or on any other soil in California. If we have any subscribers who have ever sown red clover and succeeded with it we will be glad to hear from them. Alfalfa is so much superior to it that we would recommend its use in this case. Bees make some of our finest honey on alfalfa.

Ground Squirrels

What is the cheapest way to get rid of ground squirrels? Our orchard is filled with them and they do much damage.—Subscriber, Lamanda Park.

Probably the quickest method is to use the gases created from carbon bisulphide or similar substance. This is sometimes done by placing waste cotton saturated with the bisulphide in the hole and closing it quickly. It is more satisfactorily accomplished by the use of an appliance which has been advertised in the Cultivator, and which is recommended by the government service which has investigated the squirrel situation in California. The appliance is not patented, or rather we believe it was patented by the government and its use dedicated to the people, but it has been manufactured and we understand is sold very reasonably. In addition to the foregoing, satisfactory results are obtained by the use of poison. At this time of the year when the fields are covered with green feed poisoned dry grain proves successful. The formula recommended by Dr. Blue is as follows: Whole barley, 20 pounds; starch paste, one pint; strychnine sulphate, one ounce; saccharine, one dram. The barley is placed in a receptacle large enough to permit thorough stirring (as a wash tub). One pint of water is then brought to a boil and sufficient laundry starch (about two tablespoons dissolved in a little cold water), is slowly added to form, when well cooked, a paste about the consistency of cream. The strychnine (first powdered if in crystals) and the saccharine, are now added to the hot starch paste and the mixture well stirred until dissolved. While still hot this is poured over the barley, mixed well, and the whole put aside for several hours before using. Persistent work is necessary in dealing with this pest. One treatment with the gas or one poisoning is not sufficient. A day or two after the first treatment the field should be thoroughly inspected and another treatment given wherever there is any indication of live squirrels. If the orchard is surrounded by unimproved lands they should be treated for a reasonable distance away from the boundaries.

Stock for Pear

What is the best stock on which to graft Bartlett pears which are to be planted on light sandy soil with ample moisture?—Subscriber, Santa Rosa.

If a dwarf is desired then the quince stock is best. However it is seldom used in California. The stock usually preferred is the seedling pear which is brought to this state in large quantities from France. Select only the very choicest and thriftiest of the seedling roots. Some prefer Japanese stock and again others prefer the rooted cuttings of Le Conte, which is more resistant to blight.

Field Rats

Will you tell me how to poison or exterminate common field rats? They are destructive here on tomatoes and peppers.—Subscriber, Fulford, Florida.

This is not a pest with which California has had to deal and we know nothing as to its control. Would suggest to our subscriber that he write to his state agricultural station at Lake City and we think he may secure information which will aid in the control of this pest.

Stock Damaging Crops

I have a neighbor who allows his pigs, about 35 in number, to run at large. He has been asked several times to keep them up on account of their doing damage but he refuses to look after them. They are rooting up my grain and doing considerable damage. What recourse have I? May I shoot them or shut them up? If I shut them up can I make him pay me damages before turning them over to him?—Subscriber.

California laws are somewhat contradictory in this matter. One law stipulates that the crop owner may not collect damages for crops destroyed by trespassing stock unless his field was surrounded by "substantial fences," but under another law it is possible to have any stock at large impounded and if impounded on any person's ranch they may collect "reasonable costs" for feed while the stock is kept. In this case the stock should be put up and notice served on the owner that he may have it for the usual fee and costs of feed. This gives no opportunity to collect any damages which the stock may have caused.

Gum Disease

Would you advise me to dig up a large tree suffering with gum disease and plant a new one in its place, or shall I cut it off near the ground and grow new shoots and feed them? Should lime be put on grove during winter and spring?—An old Subscriber.

If the tree has suffered a long time, as stated, is completely girdled and

in general poor condition, we believe we would remove it, put fresh soil into the hole and plant fresh stock. If however it shows general fair condition it might be safe to bridge graft, which, however, calls for some little experience and for best treatment of soil about the roots. Of course if such a step is to be taken the first thing to do would be to thoroughly eradicate the disease by scraping away the diseased tissue and painting with Bordeaux paste.

Plowing Orchard

I have not plowed my orange grove for two or three years. I now think of plowing it. Will plowing up the mass of little hair-like roots do harm or will tearing out roots as large as your finger harm the trees? Does pruning by plowing benefit the tree or otherwise?—An old Subscriber.

This is a long question and to answer it fully would require much space and doubtless bring out much discussion from dissenters who would not agree with the various points made. This matter of handling soil is one calling for large study. Every man's soil is to a degree different from every other man's and until the particular soil in question is known it is not safe to prescribe. In fact soil cultivation and handling can hardly be prescribed for for the reason that season by season, in fact, almost week by week, it calls for different treatment. Farming is not a calling where rules may be laid down and followed without the use of some good judgment on the part of the farmer. Personally, and speaking in a general way, we would prefer plowing at least once every year. We would plow as deeply as possible. We would root prune if the tree was of a variety that would stand for such treatment, and we think nearly all varieties of trees will. On the other hand, there are some of our best farmers who will never, unless compelled to do so, put a plow in their orchard, but there must be some way of thorough stirring the soil to its lower depths. "Tillage is manure" and "air is manure" are both true to a degree. Deep tillage introduces air into the soil and makes possible the work of bacteria, and bacteria increase fertility. Of course tillage tends to reduce humus but in doing so increases fertility, therefore the farmer must bring in new humus formers to take the place of that destroyed by deep tilth.

Millet for Morning Glory

In one of your former numbers you advocated the planting of millet to drive out the morning glory pest. How much should one plant per acre on adobe soil and what is the best time to sow?—Subscriber, Oakland.

For the ordinary German millet the amount recommended is about a peck to the acre (25 pounds). On rich soil where the desire is to make such a complete shade that it will drive out the morning glory pest we presume that amount would be beneficial. It may be planted during the next month. However, we will be glad to hear further from our subscriber who furnished this hint.

Bluing Water in Septic Tank

We recently had an inquiry regarding the dumping of bluing water and other chemicals into septic tanks and as to effect on bacteria which live upon the refuse. The question was referred to Prof. W. T. Clarke of the college of agriculture and he answers:

"As a general assertion, the wasting of ordinary bluing water used in laundry work into septic tanks would have no effect upon proper bacterial action in such tanks. The bluings used in laundry work are either analine products or ultra marine. If a saturated solution of either of these were to be flowed into the septic tank, it would of course cause undesirable conditions, but such concentrates as these are never used in laundry work and certainly by the time the solution got to the septic tank it would be diluted to such a state that it would be absolutely harmless. The same idea holds in regard to the use of potash and caustics and acids for clearing greasy pipes and traps. If these are used in concentrated form they would undoubtedly cause stoppage of bacterial action, but the ordinary dilution that occurs in flushing overcomes completely their injurious possibilities.

Rabbits

What is the market value of rabbits in Los Angeles? What breed is best to raise for market? Is there a steady market demand for them and how does the price run?—Subscriber, Rosamond.

The buying prices will range from eight to ten cents per pound but the demand is not yet sufficient to give as stable a market as poultry commands. We would advise the Belgian hare breeder to begin in a very moderate way and build up his own market. We do not mean that it should necessarily be his own retail market, but a general outlet should be secured through a retail dealer, or otherwise. Some day we believe the rabbit will be as much of a staple as is beef and poultry, but until that time it is not well to go into the business too extensively without thoroughly understanding market conditions. It would probably not be possible for the largest market on the Pacific Coast to take a carload of Belgian hares and yet many carloads of poultry are handled every week. The Belgian and the Flemish Giant are probably the best meat breeds.

Grafting Apples

We have about 50 trees, 15 years old, variety a hard red apple. We wish to have them grafted into Jonathans,

From George Washington *to* Grover Cleveland

PURE IRON COFFIN NAILS

UNHARMED BY RUST AFTER A HUNDRED YEARS

ON the 6th of November, 1792, when George Washington had been elected President for his second term, one of the veterans of the Revolutionary Army was buried in the Cemetery at Fort St. Clair, Ohio. One hundred years later, within a day or two of the election of Grover Cleveland, this grave was opened. The nails which had been used in making the box were found to be as good as new. Chemical analysis showed that they had not rusted out because they were made of iron that was 99.83 *per cent pure*,—containing hardly more than a trace of Manganese, Sulphur and Copper.

ARMCO AMERICAN INGOT IRON CULVERTS

are made of iron even purer than these nails, every sheet or plate being guaranteed to be at least 99.84 per cent. Pure Iron, and the average actual purity being over 99.87 per cent. It contains altogether not more than 12 to 16 one-hundredths of one per cent. of Manganese, Sulphur, Copper and all the other impurities which cause steel and ordinary iron to rust in a short time to complete failure. Properly installed, these culverts give service for an immensely long period, and this without any repairs or attention.

It is because of their Lasting Quality, their strength and toughness and their adaptability to the requirements of highway construction and maintenance that road builders and engineers everywhere are now specifying Armco Culverts with the triangle trade-mark on every section. *Look for this brand on the culverts that go into your highways.*

There is a manufacturer in your vicinity. Write him.

THE AUTO-OILED WINDMILL WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of this 8-foot auto-oiled windmill will keep the gears and every bearing flooded with oil for a year or more.

The galvanized steel helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The mill needs oiling but once a year.

There is a windmill, known the world over as "the windmill which runs when all others stand still." This new windmill with gears and bearings flooded with oil runs in much less wind than that well known windmill.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The auto-oiled windmill, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable. Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof.

There is no friction on any part of the furling device when the mill is running and very little when the wheel is furled.

DUPLICATE GEARS RUNNING IN OIL

Oil Annually

EVERY BEARING FLOODED WITH OIL

A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service.

A band brake, of the automobile type, is used, and it always holds.

The gear case contains two pairs of gears and the supply of oil. From this gear case the oil circulates to every bearing in a constant stream. It flows out through the friction washers in the hub of the wheel and is automatically returned to the gear case. Not a drop of oil can escape. It is used over and over. So long as there is any oil in the gear case the gears and every bearing will be flooded with oil.

If you are tired of climbing a windmill tower; If you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Running water purifies itself—stagnant water, standing water, collects and retains impurities. If you pump from your well constantly all the water it can spare, the water that comes in to take its place will be pure. If the water in your well stands until you happen to want some, and you pump but little, then it is likely that surface water will flow into it and carry in impurities. The unsafe well is the one that has standing water. A flowing stream is the thing to be desired.

The auto-oiled windmill makes all this possible as it can run from one year's end to the other with practically no wear and no cost. If interested, write Aermotor Co., 1146 So. Campbell Ave., Chicago. Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. Water costs nothing. Use it. To let it stand is to abuse it.

We need and must have the best dealers everywhere. They need us if they are going to remain in the windmill business. Write right now.

Be A Producer

Don't waste your time. Spend it in your garden. The European war has caused a tremendous demand for American products, and has boosted all foodstuffs. In the midst of this high cost of living, your small ranch, back yard or old corral lies unproductive. A few cents in seeds will produce dollars for you in vegetables, and a wealth of bloom.

We offer the highest quality of seasonable seeds bought by our corps of experts, and tested at our famous Trial Grounds in our latest and best innovation

MADE TO ORDER
FEBRUARY
GARDEN COLLECTIONS

Not the ordinary seed collection, but a collection to be selected by yourselves from a large variety of seasonable vegetable and flower seeds, plants, trees, insecticides, etc. We offer these collections at a reduced rate of 1½ to 1, for instance, $1.50 in seeds for $1.00, and as high as $75.00 in seeds, etc., for $50.00. We make this extraordinary offer because the observance of a few labor saving conditions enables us to give you the benefit of this saving.

Spitzenberg, Rome Beauty or Banana. Is this practical, providing we can get a man who understands grafting? If unable to get such grafting stock from this vicinity where can we procure it cheaply? The variety we are to graft is not marketable. Elevation of orchard 2400 feet.—Subscriber, Santa Barbara.

The grafting over of apples is comparatively easy but in choosing the variety we would recommend investigating as to the variety which has proved most successful in your particular section. There are hundreds of different apples and some reach perfection in one section, but are of little value in another. If you cannot get the scions referred to in your own section it is fairly good evidence that they have not been tested out and we would be cautious about grafting trees to those varieties.

Muscats Not Bearing

I have Muscat grape vines on sandy land which make fine growth but do not bear much of a crop. Is this on account of the pruning? What shall I do to make them produce larger crops?—Subscriber, Selma.

This question was submitted to Prof. Bioletti, who writes:

"Regarding the best table grapes to plant, in the first place there is such a great number of good table grapes and the conditions you make are not sufficient to limit our choice among this number very closely. However, I will mention a few varieties which have shown commercial value and may do well under the conditions you have in mind. For early grapes the standard has always been the Sweetwater or Golden Chasselas. Equally good, or better, are the Rose Chasselas and the Luglienga. In the hotter regions the Khalili and the Persians 21 and 23 are equally early or more so and more striking in appearance. For midseason grapes the standard varieties grown in California are the Sultanina (Thompson Seedless), the Muscat, Malaga and Tokay. Among other varieties equal to, or superior to these, may be mentioned the following: Rose Sultanina. This is a rose-colored form of the ordinary Thompson Seedless which, however, does not seem to develop its color well except in the cooler regions. Pizzutello and Alhakahi are two of the so-called Lady Finger grapes which are very striking in appearance and come into the market in small quantities. The Flame Muscat is a red form of the ordinary raisin Muscat and will undoubtedly be profitable in some districts. The Muscatelle Fino or Muscat Hambro are black Muscats which are much preferred to the ordinary Muscat by most people. The Malvasia Bianca is a white Muscat which is of most excellent flavor and texture and bears well. Varieties similar to the Malaga are the Dattier and Olivette. The former is larger and earlier and the latter appears to ship a little better. The Golden Queen is a somewhat similar variety which is very promising. Of red grapes, the Zabalkanski and the Maraviglia di Malaga are worth trying. For late grapes, the bulk consists of Emperor, Cornichon and Black Morocco. To these might be added for fairly warm districts the Gros Colman."

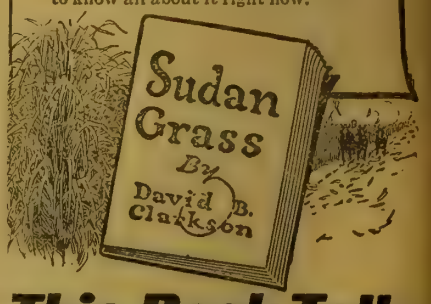
LANGUAGE MIXED

"That," said the physician, as he examined the lump on the man's neck, "is the remains of an old boil that started to come and then became encysted there."

"Well," said the unlettered patient, "it sure has encysted on stayin' there."—Chicago Post.

SUDAN GRASS

has proved to be the most profitable forage crop ever grown in America. Farmers who have planted it are making $20 to $100 an acre on hay, and from $300 to $700 an acre on seed. It yields the biggest tonnage to the acre of any high-class hay known. If you plant Sudan Grass, you never have to buy feed for your stock. As a catch crop, it turns loss into profit by replacing crops that have failed because of drouth or flood. By rotating it with other crops, you conserve and increase the fertility of your soil. Sudan Grass is one of the big factors that are bringing prosperity to the South. You ought to know all about it right now.



This Book Tells All About It

I am the largest grower of Sudan Grass in America. I have studied it for years. This book contains everything I have learned about Sudan Grass. It is complete and absolutely reliable. It is the first and only book ever published that tells all that is known about Sudan Grass. Profusely illustrated with actual photographs of growing, harvesting and threshing Sudan Grass.

Prof. B. Youngblood, Director of Experimental Stations for the state of Texas, says—"Mr. David B. Clarkson: "I have read your new Sudan Grass book. Glad to note that it brings forth the most comprehensive and authoritative information on Sudan Grass as yet published in book form."

Don't Start Wrong! —Don't commence growing Sudan Grass until you know how to secure, grow and keep seed pure, how and when to plant, where and on what kind of soil it will grow, how to cultivate and harvest for hay and seed, how to thresh, and all other particulars. My book tells you everything.

A Wonderful Book for 10c

This book may prove to be worth thousands of dollars to you. I want every American Farmer to know all I know about Sudan Grass. Merely send your name and address, with 10c, to show that you are seriously interested, and I will send you this book postpaid. Send 5 two-cent stamps or a 10-cent piece. Address P. O. Box 136

David B. Clarkson, Robstown, Texas

What Others Say

This is what Drs. J. E. & G. M. Minney of "MINNEY RANCH" say about Commercial Engines:

"We have used one of the Commercial 60 H.P. distillate Engines for one season without one cent for repairs, and all bearings, so far as we can see, are just nicely smoothed.

One day of eleven hours we irrigated 18 acres on 55 gallons of distillate, or at the rate of 30-5-9ths cents per acre. It was our highest lift, including suction, 65 feet, pumping 250 inches.

We think the Commercial Engine has no superior."

LINCOLN

By Edmund Vance Cook

Bulwark and barbacan, grim and tall,
Keep and turret and moated wall
Portico, peristyle, stately hall,
Palaces, castles, courts, and all;
Lofty minaret, lordly dome,
Humble yourselves at the childhood home.
Of Lincoln

Made of a few sticks, clumsily cut;
No window to open, no door to shut;
So wretched, indeed, that the name of hut
Were gilded praise of its poverty; but—
By the kernel alone we must judge the nut.
Who could have dreamed in that early hour
That out of such muck would have sprung the flower—
A Lincoln!

Reactionaries! who strive, to-day,
To hold that men are of different clay;
Oligarchs! plutocrats! ye who say
The fathers were wrong, and yea or nay
May answer a People's Rights, to-day,
That some are to rule and some obey,
One plain word shall command your shame;
Into your faces I fling the name
Of Lincoln

Whence did he come? From the rearmost rank
Of the humblest file. Was it some mad prank
Of God that the mountains were bare and blank
And the strong tree grew on the lowliest bank?
Not so! 'Tis the Law. The seed blows wide
And the flower may blossom as the garden's pride,
Or spring from the ditch. Nor time, nor place,
Conditions nor caste, nor clime nor race
Can limit manhood. The proof is the case
Of Lincoln

How was he trained—this untaught sage,
With nothing but want for his heritage?
Set to work at the tender age
Which should have been conning a primer page—
His whole youth spent for a pitiful wage
As axman, farmer, boatman, clerk;
Learned alone in the school of work
Was Lincoln.

What was his power? Not kingly caste,
Nor jingle of gold howsoever amassed;
Not Napoleon's force with the world aghast;
Not Tallyrand's cunning, now loose, now fast;
Not weak persuasion or fierce duress,
But strong with the Virtue of Homeliness
Was Lincoln.

Homely in feature. An old style room,
With its tall, quaint clock and its old, quaint loom,
Has very much of his home-made air.
Plain, but a plainness made to wear.
Homely in character. Void of pretense;
Homely in homeliest common sense.
Homely in honesty. Homespun stuff
For every weather, mild or rough.
Homely in humor, which bubbled up
Like a forest spring in its earthen cup.
Homely in justice. He knew the law,
But often more than the letter he saw;
And, sheathing the sword to its harmless hilt,
Wrote "Pardon" over the blot of guilt.
Homely in patience. His door stood wide,
And carping and cavil from every side
Dinned in his ears, but he went his way
And did the strongest that in him lay.
Homely in modesty. Never a claim
Of credit he made, and he shirked no blame;
Yet firm in his place as the hemisphere
When principle said to him, "Stand thou here!"
Homely in tenderness. Motherhood's breast,
Where the new babe cuddles its head to rest,
Is not more gentle than was his heart;
Yet brave as a Bayard in every part
Was Lincoln.

O, Uncommon Commoner! may your name
Forever lead like a living flame!
Unschooled Scholar! how did you learn
The wisdom a lifetime cannot earn?
Unsainted Martyr! higher than saint!
You were a Man with man's constraint.
In the world, of the world, was your lot;
With it and for it the fight you fought,
And never till Time is itself forgot
And the heart of man is a pulseless clot,
Shall the slow blood flow when we think the thought
Of Lincoln

THE COMFORTER

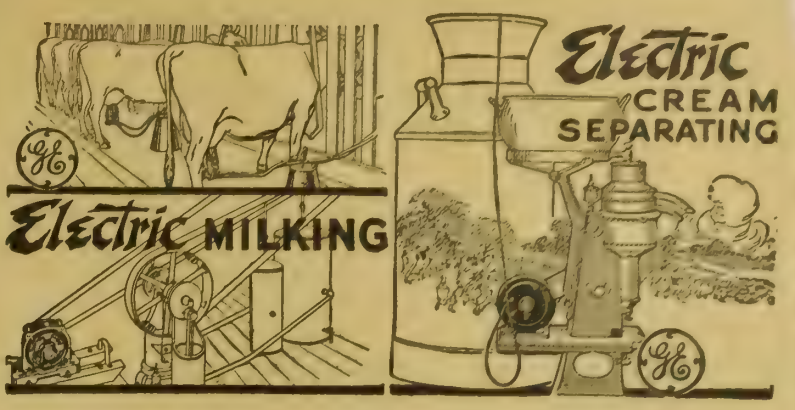
By F. A. Mitchell

When the great struggle between the Northern and Southern states come on Allan Fitz Hugh, twelve years old, was at school in Virginia. He was a boy of delicate physique, but was full of fire, and, hearing that Abraham Lincoln was coming Southward at the head of an armed force was much troubled because he was too young to shoulder a musket and repel the invader. He found it difficult during those exciting times to attend to his studies, and had it not been for the influence of his mother he could not have been kept at school at all.

> And having thus chosen our course, without guile and with pure purpose, let us renew our trust in God and go forward without fear and with manly hearts.—Lincoln.

In those days the passion attending war ran high on both sides. The songs, the gibes, the speeches and what was written concerning the great struggle were very bitter and usually far from the truth. In the North it was "We'll hang Jeff Davis on a sour apple tree," and in the South President Lincoln was called "the baboon." The Northern schoolboy conceived the idea that President Davis was an ogre, not realizing that he was an educated gentleman, had commanded a regiment of United States troops in the war with Mexico, had been a United States senator and secretary of war. The Southern schoolboy considered President Lincoln a wild man from the Western woods who delighted in bloodshed. Children whose minds are not developed must concentrate upon one head in any movement in which they are interested. So Allan's thoughts dwelt upon Mr. Lincoln, embodying in him the whole Northern army, which was to him a terrible horde coming down to destroy the South.

When Allan was fifteen he begged his mother to let him go to fight for the Confederacy. Naturally she clung to her son, and the matter was compromised between them in this wise:



Save Labor on Your Farm This Winter

For less than half the cost of keeping an extra hand you can have your cows milked, your cream separated, and practically all your chores done by a

G-E ELECTRIC MOTOR FOR RANCH AND FARM

G-E motors will also drive irrigation or house pumps, circular saws, wood splitters, ensilage and feed cutters, corn shellers and many other farm machines besides household labor saving devices such as washing machines, food choppers, dish washers and the like.

A G-E motor is easy to operate, does not get out of order, and costs but a trifle to run. A G-E motor pays for itself many times over through savings in time, labor and wages.

"Let G-E Motors do your work"

If the war was not over in another year Allan was to enlist with his mother's consent. Many boys of his age, both in the North and in the South, broke away from parental restraint and enlisted without permission. Food for powder was in demand, and the recruiting officers often winked at the fact that the recruits were under age.

So Allan continued at his studies, though he read more about the battles that were being fought than the subjects treated of in his textbooks. He lived in Richmond and at one time had listened to the roar of cannon during the seven days' battles that had been fought between Lee and McClellan. His admiration for soldiers wore away some of his bitterness against the federal generals, but President Lincoln was still the embodiment of his repugnance for the Northern people. The two heads—Davis of the confederacy and Lincoln of the federal union—throughout the war continued to represent the bitter antagonism felt by either side.

In the early spring of 1865 Allan Fitz Hugh came to be 16 years of age and his mother reluctantly consented to his doing his part to fill the gaps in the Southern ranks made by Northern missiles. When the time came for him to leave his mother he was seized with a foreboding that he would not see her again. It is questionable which suffered the more at the parting, mother or son.

Allan enlisted in time to take part in one of the last battles of the war. He saw a dark line of blue on the edge of a wood behind earthworks. With the confederate line of battle he moved toward it. Suddenly a storm burst in his face. He felt himself collapse and sank down on the ground.

His companions in arms went on, but were soon driven back and over him, leaving him there with a stream of blood flowing from his side.

Later he was picked up by a federal ambulance corps and placed on a stretcher. He believed himself to be dying, and, oh, how terrible not to be able to bid his mother goodby!

"Mother!" he cried. "Oh, mother!"

A tall, spare man in citizen's apparel heard the wail and directed the carriers to put down the stretcher and, kneeling beside it, asked tenderly:

"What can I do for you, my poor boy?"

"You are a Yankee. You will do nothing for me. I wish to send a message to my mother, but it will never reach her."

"Give me your message and I promise you that I will send it for you."

The next morning Mrs. Fitz Hugh heard of the batle and knew that her son had been in it. While she was wondering what might have been his fate a man rode up to her and gave her a message, stating that it had come by a flag of truce.

Starting for the front at once, the anxious mother succeeded in bringing her boy home. He hovered for some time between life and death, then began slowly to recover. Not long after this Richmond was evacuated by the confederates, and President Lincoln went down there from Washington. When he was riding through the street on which the Fitz Hughs lived Allan was propped up in an easy chair on pillows, and his mother pointed out Mr. Lincoln to him.

"Oh, mother!" exclaimed the boy.

"What is it, Allan?"

"He's the man who comforted me when I was carried off that dreadful battlefield, and he sent you my message."

IDEAS FOR THE COOK

Written for California Cultivator
By Isabel Cottle

Breakfast

Baked Canned Pears
Broiled Pork Chops Creamed Potatoes
Cornmeal Cakes Honey
Coffee

Lunch or Supper

Cream of Spinach Soup
Baked Cheese in Ramekins
Cold Sliced Ham
Red Bean Salad
Warm Doughnuts
Spiced Baked Apples
Tea or Milk

Dinner

Baked Meat Dumplings
Creamed Turnips
Wilted Lettuce
Whole Wheat Bread
Blackberry Jelly
Prune Pie, Whipped Cream
Coffee

Whole Wheat Bread

Scald one cup milk and one cup water, when lukewarm add one cake compressed yeast dissolved in one-fourth cup lukewarm water, one-half teaspoon salt, and enough whole wheat flour, about three cups, to make a stiff batter. Beat well for five minutes, lifting the dough high in the air and folding it over. Scrape down the dough from the sides of the bowl, cover with a clean cloth and place in a warm place for two hours. By this time the mixture will be light and spongy. Stir in slowly enough whole wheat flour to make a dough. Turn out onto a floured board and knead until soft and elastic, and no longer sticky. Form into two or three loaves as desired, place in greased pans, cover and stand in a warm place until double in bulk, about one hour. Bake in a moderate oven three-quarters of an hour.

Baked Canned Pears

Place halves of canned pears in baking pan, sprinkle lightly with sugar, add a lump of butter for each half, and pour around the liquor remaining in the can. Bake until well heated through and a rich syrup is formed. Serve warm. For variety cinnamon may be sprinkled over before serving.

Baked Cheese

Take one and one-half cups grated cheese, one-half cup bread crumbs, one cup milk, one egg beaten light, a little paprika and salt to taste. Put in ramekins and bake 15 minutes in quick oven.

Baked Meat Dumplings

Make a dough as for shortcake, roll

out and cut in squares. Take one cup of cold boiled meat, one cup of bread crumbs, one cup of hot mashed potatoes, two eggs, pepper, salt and butter to season. Beat all well together and place one large spoonful in the center of each square, bring the corners all together in the center and pinch them so they will hold. Bake in a quick oven.

Red Bean Salad

One-half cup kidney beans, cooked; one-half sweet pickle, chopped fine; one tablespoon chopped celery, dash of tabasco sauce, dash of Worcestershire sauce. Mix ingredients and serve with Mayonnaise dressing.

HOUSEWIVES' EXHIBITS AT NATIONAL ORANGE SHOW

To aid what the orange growers believe is a vital part of the citrus fruit industry, the National Orange Show, to be held in San Bernardino, February 17-24, will give a daily demonstration of the preparation of dishes which can be made from oranges and lemons. A committee of women is to have charge of the feature. Housewives in the citrus fruit sections have discovered how to make many delicacies from oranges and lemons that are unknown in the vast majority of homes even in California. The women will demonstrate how the various dishes are prepared and give recipes to the visitors who are interested.

In addition to the extensive housewives demonstration and exhibit there will be exhibits from manufacturers and from the domestic science classes of many schools of the state.

NEW USES FOR THE CRANBERRY

No other fruit contains the same acid as cranberry. This salicylic acid acts upon brass, tin or iron when brought in contact with it, and for this reason it is advisable to cook the berries in earthen or porcelain-lined vessels, agate or granite ware.

As soon as the cranberries are cooked turn them immediately into the mold. Never allow any article of food containing cooked cranberries to stand in anything but glass or stoneware. The best cranberries are inexpensive, yet they adapt themselves to various styles of dishes that may be surprising to the housewife who has never tried to use them in any other way than in jelly and in sauce.

Wash and remove all defective berries before cooking. Cranberries may be made into ornamental dishes without much trouble, and yet are sufficiently simple to be prepared by an inexperienced cook.

Cranberry Bavarian Cream

Whip two cups of double cream to a stiff froth, add one cup of sugar and one tablespoon gelatin which has been softened in four tablespoons of cold water and liquified over hot water. Keep the basin in a pan of ice until the mass begins to thicken perceptibly; then stir in one cup of strained and sweetened cranberry juice. Fill a mold and pack in ice and salt for four hours.

Cranberry Sherbet

One of the most appetizing ways of serving cranberries that require but little time for preparation is sherbet. The tart flavor will be found palatable in place of the many sweet varieties of sherbet. To four cups of stewed cranberry juice add the strained juice of six oranges and four cups of granulated sugar. Pour into an ice cream can and freeze until of a mushy consistency. Whip stiff the whites of four eggs, stir into the cranberries and complete freezing.

Cranberry Conserve

Pick over and wash sufficient cranberries to weigh five pounds, then chop them coarse. Put two pounds of cleaned seeded raisins through the food chopper, then mix them with the cranberries. Thinly peel the rind from four large oranges, boil it in water, changing the water several times until the rind is tender, then chop fine. Put it into a saucepan, add the cranberries, raisins, ten cups of sugar, the pulp and strained juice of five oranges. Heat and cook slowly until reduced to a jam, then seal. This is excellent with meat.

Cranberry Frappe

Boil one quart of cranberries and two cups of water for ten minutes. Strain through coarse cheesecloth, add two cups of sugar and boil until the sugar is thoroughly dissolved, stirring meanwhile. When cold add the strained juice of two lemons; if too tart add more sugar. Freeze to a mush, using equal quantities of ice and salt. Serve in glass cups with roast turkey.

Scalloped Cranberries

Moisten two cups of soft white bread crumbs with half a cup of melted butter. Butter a pudding dish, sprinkle in a layer of bread crumbs, add a layer of stewed and sweetened cranberries; twelve large seeded raisins, a little grated lemon rind and a little sugar; continue the layers until the crumbs are used, cover and bake for half an hour in a moderate oven. Serve hot with hard sauce.—Good Housekeeping Magazine.

AN ENGLISH RAILWAY'S BATTALION

To meet the case of men who would prefer to enlist among those whom they know, the directors of the North-Eastern Railway of England have asked Lord Kitchener's authority to enroll a North-Eastern Railway battalion for his new army. One thousand one hundred men are required, and a sufficient number are willing to join. Already over 4000 of the company's employes from all departments have enlisted as regulars and territorials. The directors have undertaken to make adequate provision for dependents of men who enlist, to keep their positions open, and to make the arrangements for equipping and clothing the battalion.

THE USUAL DISAGREEMENT

"Plaster me up!" called Justin, aged 7, to his astonished mother as he rushed into the house. "Me an' Red's been fightin'."

With the wisdom of past experience, she washed, bandaged and plastered him before inquiring:

"What was the disagreement about, Justin?"

"Well, mamma," replied her son, after considering the question for some moments, "it mostly was me a-thinkin' I could lick Red, an' him a-thinkin' he could lick me."

FEAR BLOCKS ACTION

"But little is accomplished, because but little is vigorously attempted; and but little is attempted, because difficulties are magnified. A timorously cautious spirit, so far from acting with resolution, will never think itself in possession of the preliminaries for acting at all. Perhaps perseverance has been the radical principle of every truly great character."—J. Foster.

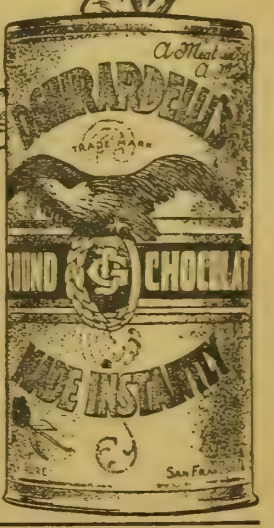
Chocolate Bavarian Cream

Soak one-half box gelatine in cold water until soft; add it to two cupfuls milk, which has been scalded, with four tablespoonfuls Ghirardelli's Ground Chocolate, stirring until dissolved. Remove from fire, add one-half cupful sugar, and one teaspoonful vanilla extract. Turn into granite basin, set in a pan of ice water, stirring until it begins to thicken; add two cupfuls of cream whipped to a stiff froth. Line a mould with peaches, turn in the mixture, set in a cold place until firm. Unmould and serve with whipped cream.

As a flavoring for cake, icing, cake filling, candy, ice cream and sauces,

Ghirardelli's Ground Chocolate

is unequalled in its purity, its economy, its flavor—It has enjoyed an unrivaled reputation for more than half a century.



As a daily beverage its health-promoting qualities as well as its low cost per cup recommend its use.

Sold by Grocers everywhere in hermetically sealed tins.

Citrus Fruit Market

Los Angeles, Feb. 3, 1915.

Another cold streak has frozen up another lot of California oranges in transit. Last week's blizzard, which covered almost the entire East, has caught to a greater or less degree some 300 cars. Of course many of these will be saved, but some are seriously frozen. This, together with the general dragging condition of the market, is making an uphill task for sales managers. Every sale has to be forced, which means often concessions in prices. Regarding prices, it may be in order to refer to the fact that a year ago this same week Florida oranges were commanding an average of nine cents more than California oranges. This year Californias are commanding 43 cents above Florida averages, a net difference of 52 cents, which is proof of the recognition the market is granting to California quality. Florida grapefruit is also in bad; many sales going at less than $1.50.

The lemon situation is practically the same. Foreigns are continuing to come in immense quantity, practically double shipments of any preceding year at this time. It was rumored that shortage of box shooks would discourage further shipping, but this has been overcome, at least to a degree.

Shipments.

Shipments of oranges to date since November 1, 1914, 3767 cars, lemon 799; total 4566. To same date last season, oranges 4137, lemons 369; total 4506. From Tulare county this season, oranges 5049, lemons 124; total 5173. Last year same date, oranges 4209, lemons 25; total 4234. From northern counties, oranges 555. To same date last season, 385.

CULTIVATOR—2-2 .. ..

PHILADELPHIA, Feb. 1.—Three cars navels, one car lemons sold. Cold, raining. Thirty-three cars Floridas selling today.

COUNTRY LIFE CLUBS

(Continued from Page 141)

Remember that "great oaks from little acorns grow." Show your appreciation of the efforts being made for bettering the conditions in the community by being cordial and friendly towards the instructors being sent to us. If anything has especially interested or benefited you, tell them so. Let them feel that their efforts have not been in vain. Do you think that our public school teachers are benefited and encouraged by the hearty cooperation of the parents? It will be the same in this work.

The boar should not be used for service until eight months old; and from 15 to 20 sows are enough for the young sire to breed the first year. The young boar should be handled carefully, and until fully developed should be fed a strong growing ration, and given plenty of exercise. Afterwards during idle periods he can be kept on a maintenance ration, preferably grass and a limited amount of grain. Instead of risking a new, untried sire each year it is usually the best practice to keep a boar as long as he can be used to advantage.

PERFECT IMITATION

He—Don't you think, now, that the woman of today in her endeavor to imitate man is acting like an idiot?

She—What of it? Don't you think the imitation is successful?

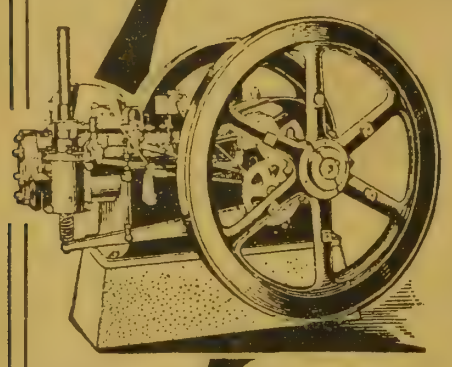
STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2¾c per gallon, cost one third of a cent per H.P. per hour to operate.

All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.



Before you buy an engine send for our catalogue—free to all who write for a copy.

Studebaker

WAGONS BUGGIES HARNESS

WHY IT PAYS TO BUY A STUDEBAKER

I am using a Studebaker Farm Wagon which has been in constant use for 35 years. The wagon was bought from J. D. Lester by Fred. Gruner and was used for hauling grain to Telena, fifteen miles away.

I bought the wagon from Mr. Gruner and have hauled as high as 50 bushels to the load.

The wagon has been in several runaway accidents but has never had a broken wheel or axle, nor has a new felloe or spoke been put in.

The wagon is in excellent condition and is being used every day.

C. E. Stephenson,
Atwood, Ill.

Hauls his grain to market in 35 year old Studebaker

HERE'S a Studebaker wagon that has had hard usage for thirty-five years, served two owners and is still on the job.

And this isn't an exceptional Studebaker, for we have thousands of testimonials telling similar stories about the long life and good service Studebaker wagons have given.

Why Studebaker's Last Longest

These many long lived wagons are the result of Studebaker superiority; a superiority which comes from the long ageing and weathering of the timber, tested steel, the splendid standardization of the manufacturing processes and the rigid requirements of test and re-test through which each wagon has to pass. Even Studebaker paint and varnish is analyzed before it is used.

But, remember, since paint can make all wagons look of equal quality, *appearance* is a most deceptive thing. And that since the cost of a farm wagon is in direct proportion to its length of life, that wagon is the *cheapest* that can *prove* the longest average term of service.

To make sure you will get a lifetime of service, buy a Studebaker. You will never regret having bought it.

Studebaker Buggies and Harness are also built to outlast others.

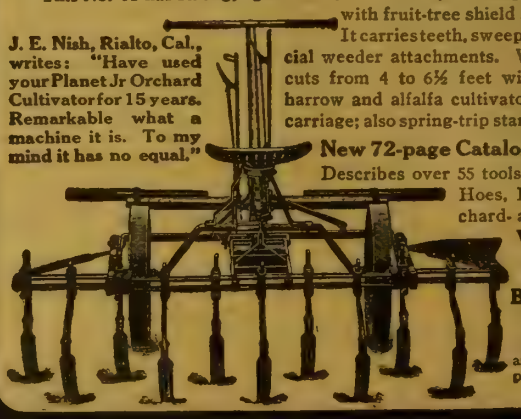
Planet Jr. Orchard Cultivator

For the fruit-grower who wants maximum profits this **No. 41 Planet Jr Orchard and Universal Cultivator** is an absolute necessity in the orchard, vineyard, or hopyard. Its strong, durable construction and lasting service make it the most economical orchard cultivator you can buy.

This No. 41 has strong, light frame, low wheels, and tongue, all of steel. Is equipped with fruit-tree shield and side-hitch for low trees. It carries teeth, sweeps, furrowers, plows, and special weeder attachments. Works deep or shallow, and cuts from 4 to 6½ feet wide. Convertible into disc-harrow and alfalfa cultivator. Can be fitted with fore-carriage; also spring-trip standards, and irrigation steels.

J. E. Nish, Rialto, Cal., writes: "Have used your Planet Jr Orchard Cultivator for 15 years. Remarkable what a machine it is. To my mind it has no equal."



New 72-page Catalog (168 illustrations) **free!** Describes over 55 tools, including Seeders, Wheel Hoes, Horse Hoes, Harrows, Orchard- and Beet-Cultivators.

Write postal for it today.

Better Crops on Perfect Seed Beds

Prepared with the

ACME Pulverizing Harrow

AFTER plowing sod or stubble, it must be worked down thoroughly and pulverized. Sods, clods and lumps must be broken up; air spaces and voids worked out and filled to insure a good seed bed that will give BETTER CROPS. Make available the plant food in plowed in manure by thoroughly mixing with pulverized soil. BETTER CROPS will result. The "ACME" PULVERIZING HARROW makes possible the perfect seed bed. Sizes 3 to 17½ ft. wide, for one to four horses.

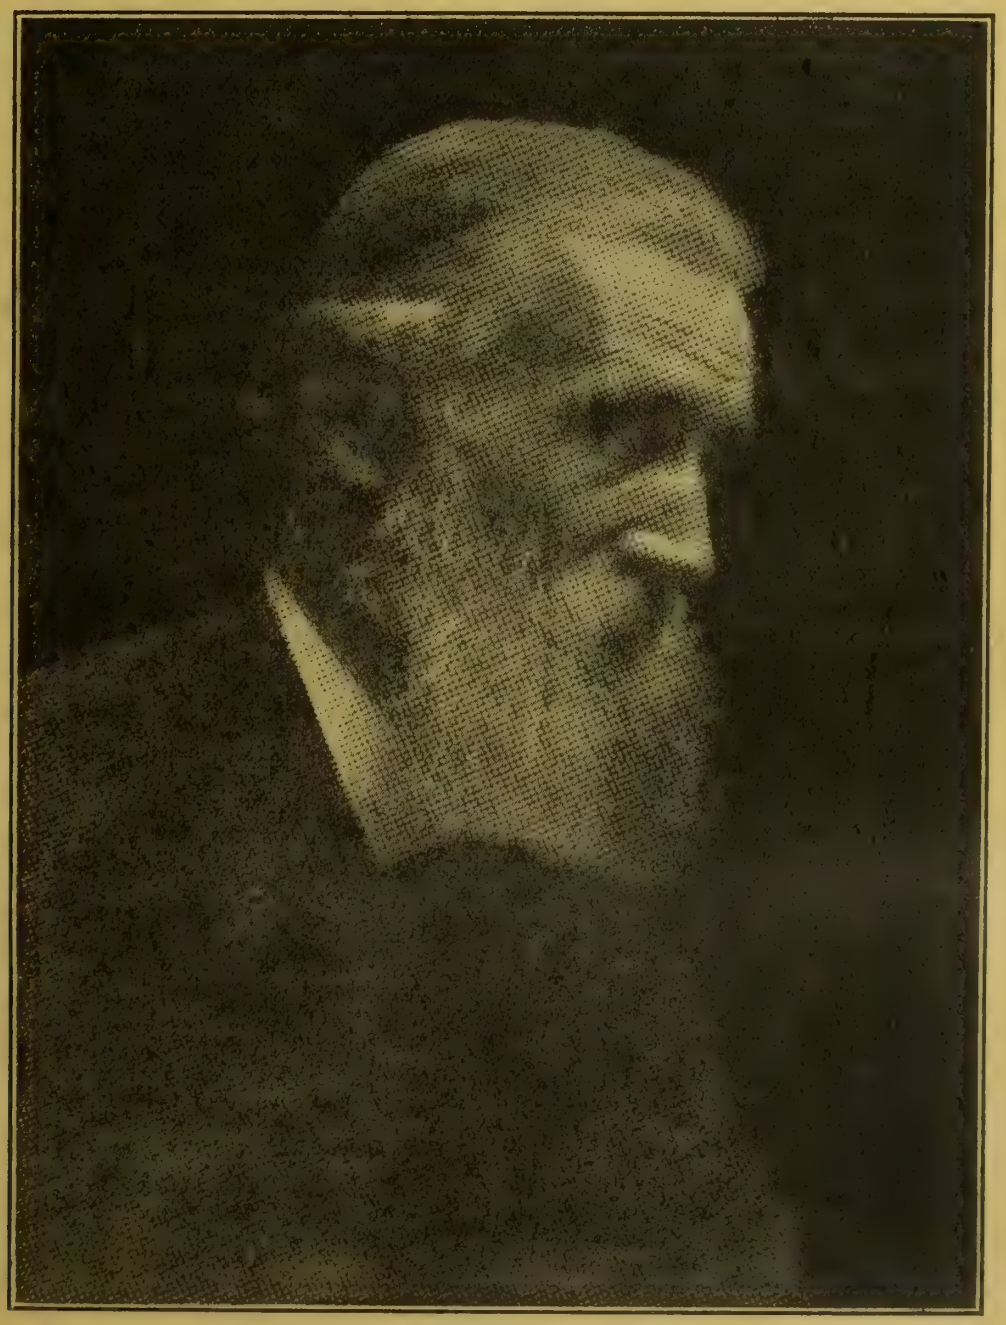
CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES February 11, 1915 SAN FRANCISCO

A California Tree Lover



"The coniferous forests of the Sierra are the grandest and most beautiful in the world, and grow in a delightful climate on the most interesting and accessible of mountain-ranges, yet strange to say, they are not well known. But few indeed, strong and free with eyes undimmed with care, have gone far enough and lived long enough with the trees to gain anything like a loving conception of their grandeur and significance as manifested in the harmonies of their distribution and varying aspects throughout the seasons, as they stand arrayed in their winter garb rejoicing in storms, putting forth their fresh leaves in the spring while steaming with resiny fragrance, receiving the thunder showers of summer, or reposing heavy-laden with ripe cones in the rich sungold of autumn. For knowledge of this kind one must dwell with the trees and grow them, without any reference to time in the almanac sense. The giant pines, and firs, and Sequoias hold their arms open to the sunlight, rising above one another on the mountain benches, marshaled in glorious array, giving forth the utmost expression of grandeur and beauty with inexhaustible variety and harmony."—John Muir, born April 21, 1838, died December 24, 1914.

WHAT THE
Sacramento Valley
THE HEART OF CALIFORNIA
Offers the Home Seeker
40 Acre Equipped Farms

Hundreds of prosperous and progressive farmers are already located in the upper part of California's great interior valley—the Sacramento Valley—the heart of California.

Have you ever stopped to consider what you could do on a farm of your own? Do you know that successful farm management calls forth the best that there is in a man and makes him utilize his foresight and ingenuity to a much greater extent than other work? Do you realize that the farmer works for himself and does not see some one else reap the benefits he himself has earned?

In the Sacramento Valley lie some of the most fertile tracts in the State. The fine deep loamy soil is waiting to produce the crops to which it is so admirably suited. An unlimited supply of water can be obtained by gravity or by drilling a well a few feet deep. All that is needed is man's labor and brain to convert these lands into veritable gardens. Here one has the long, warm summers, which give ample time for any crop to mature, and the mild rainy winters store moisture in the soil for the following season's growth.

The successful farms already seattered throughout this district are fine examples of what the conjunction of ideal climate and soil, with intelligent labor will do.

There are gently sloping lands with good drainage. They are ready now for the plow. No clearing to do; no brush to handle; no stumps to remove. It is clear, clean strong land which offers ideal home sites for thrifty men who desire to make immediate headway under most favorable conditions.

All sorts of fruits thrive here; banner crops of rice and alfalfa are produced, and the earliest vegetables and garden truck which come to the San Francisco market, are sent from this vicinity. Thousands of miners and lumber men and several large cities afford unlimited markets; railroads and river boats near at hand facilitate disposal of the crops. Farmers' co-operative societies by parcel post and express and sending directly to market are saving more and more of the profits for the growers.

A 40-acre farm, properly planted, is better than any life insurance policy. Not only does it constantly produce an income during your lifetime, but every bit of work put into the place increases by just so much its permanent value.

I want to talk with every one who is interested in securing a specially located piece of land.

Our **40-acre completely equipped farms** offer new, clean, strong lands. They are selected to suit the trees or products you wish to grow—prunes, apricots, almonds, figs, oranges, lemons, olives, walnuts, or for alfalfa, dairying and stock. They are in selected districts, close to good markets.

The equipment, combined with and included in the price of the land, establishes you at once upon a property which will return crops the first year. The equipment includes with each forty acres, trees, seed, necessary farm implements and water for irrigation, either by gravity or from pumps, and we furnish the well complete, ready for business.

I am positive that these 40-acre equipped farms will prove immensely profitable for every one who wants a home in the country or country income property.

Every one who has in mind obtaining a piece of country land should get the circular "What the Prospective Settler Should Know." The University of California, Berkeley, Cal., will send this to you FREE. It gives an accurate, unbiased statement on matters which you who want country property should know.

The lands which we offer are absolutely free from overflow; the titles are clear and guaranteed; there is no bonded indebtedness; there are not irrigation or reclamation assessments. You are buying good land, without incumbrances.

To make this offer still more attractive, we are placing these tracts on the market at a reasonable price—$150.00 per acre, the equipment included. If you want to obtain one of these farms in the early fruit district of the upper Sacramento Valley, write us for further details.

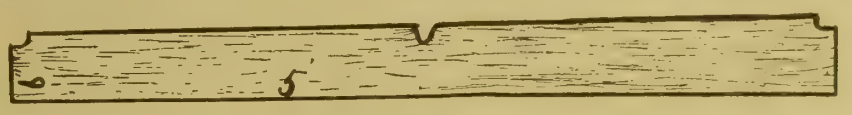
Begin the Orchard Right

Plant Thrifty Young Trees in Well-Prepared Ground. Hints from Practical Orchardists.

PLANTING season has not yet ended though the orchardist who yet has deciduous trees to plant should be busy. Presumably long before this he has discussed with himself his general location and its adaptability to the various fruits. Possibly some are yet studying as to fruit growing possibilities, and for such—and for those who have not yet planted—we give this week a symposium of great value.

First, merely a hint as to general location. There are abandoned orchards in California and still more in evidence are the orchards which have been made over many times. Without proper investigation the first orchardist planted, perhaps oranges, which proved the location to be adapted to some other fruit, then came almonds and some other fruit and finally alfalfa. The above is not overdrawn, at least in some cases. Therefore investigate fully. To determine these points take the score card. We note in a book on productive orcharding such a card and while it might need some revision for California conditions it is suggestive. In this card 30 counts were allowed for soil. Of the 30, 15 were given to surface soil, considered as to its fertility, adaptation to fruit grown, ease of working, sourness, humus content. The other 15 points were given to subsoil, ease of penetration by the roots, and fertility. Then came water drainage with 30 points, of which 10 were given to surface drainage and 20 to sub-drainage. Fifteen points were given to atmospheric drainage; will the cold air drain off, is there slope enough, does cold come down from slopes above, or is there obstruction at the bottom which will hold back cold air? The aspect or slope of the orchard was given 15 more points, slope with reference to the sun and with reference to winds. Windbreaks called for ten points as to whether they were near by or distant, kinds of trees, etc. This makes up a complete list of 100 points for the orchard.



PLANTING BOARD

For the purpose of determining soil quality perhaps nothing is better than the ordinary soil tube. These are comparatively new in orchard practice and are almost necessary for best information as to soil and subsoil conditions before planting, also as to moisture conditions when the orchard is growing.

All points as to location and fruit to be planted, trees bought of responsible nurserymen, ground levelled so that best results may be had in irrigation, deep plowing,—if sub-soiled so much the better, harrowing and planking the entire surface should be attended to. There are various devices for this smoothing or dragging or planking, the point being to secure a surface over which the chain or wire for staking the site for the tree to be can be readily handled. Most rapid work is secured with the ordinary wire marker with its tags or marks every 20 feet, or whatever the distance apart may be. The square method is usually preferred, but the contour of the land, planting closer one way than the other on account of winds and other factors, must determine the method for each orchard.

After the wire is removed use the planting board. This is shown in engraving on this page. Place the center notch of the board against the peg which stands where the tree will be. Two other pegs will then be placed at the end notches. Then the center peg is removed and the hole excavated.

If the test tube shows any indication of hardpan the use of dynamite is almost essential if best results are to be secured. One-third to one-half of a stick will usually "lift" the hardpan so as to give good large hole for spreading out of the roots.

When the trees are brought to the orchard use care that they do not dry out. The good old method of using barrels containing water in which the trees are kept until lifted to be placed in the hole is excellent. We have seen trees carted to the orchard and thrown where the holes were yet to be dug. allowed to lie in the sun and wind half a day before the moist earth was packed about the roots. This is fatal to best results. Even the hardiest of deciduous trees should be given more careful attention. Citrus trees will not stand for any such neglect at all and call for quick handling from nursery to tree hole. The planter should work roots out as nearly in the natural horizontal position as possible and insist on the shoveler delivering the dirt into the hole in a way which will not mat them all down against the tap root. It is an easy matter for the shoveler to sprinkle the dirt off the point of the shovel in a way which helps wonderfully in getting the dirt about the roots, but there are few who will follow this practice and work rapidly unless it is insisted upon. Tramp the dirt about the roots and follow with water as quickly as possible. These points are many of them referred to, however, in the articles which follow, every one of which is written by a practical planter of years of experience.

Tree Planting Ideas

A Practical Orchardist Submits Suggestions with Special Reference to the Sacramento Valley

PRUNING time is here, in fact many forehanded orchardists have already begun the work. Deciduous trees, those that lost their leaves in the winter or dormant period, may be pruned almost any time after the leaves fall until the buds start in the spring. Some extend the period even longer than that in particular cases. For instance, one man started to prune in an old prune orchard that has been neglected, soon after the crop was off and while the leaves were all on, so as to be able to more easily locate the dead branches there being many of these to be removed. There are others who believe that by the early fall pruning the late flow of sap in the tree goes to the fruit buds that will bear the fruit next year instead of being distributed to all of the buds, some of which will be removed by the prunings. Then some orchardists who are backward with their work for some reason prune their trees late in the spring after buds or even leaves have started rather than let them go unpruned. Besides that there is a summer pruning of young trees to shape the heads and summer pruning of old trees to induce fruiting.

But there are many thousands of young trees in California, one, two and three years old, that are ready to be pruned now, and the sooner it is done the better.

Arguments are advanced by different tree pruners for doing the work early or late in the dormant period. Those who advocate being forehanded with the work believe that it is a good thing to get it over with and out of the way of any unforeseen delay, that might postpone it until after the sap starts in the spring and the leaves are out. Others are of the opinion that the wounds will heal more quickly if the work is done immediately preceding the time of sap flow in the spring. Practically there is probably very little in this latter argument, and it is doubtful if any one could tell by the middle of summer whether a tree had been pruned in December or March.

In the pruning of trees there are some sound, practical and scientific reasons for different things, and dozens of superstitions and notions that have not a very sound basis. An intelligent orchardist should consider everything that he may learn from anyone about pruning, but the lack of a good sensible reason "why" some things should be done will eliminate many notions.

There is one orchardist in the Sacramento Valley who makes a careful study of his problems and who seeks the help and advice of the university authorities and practical growers as well as the so-called "tree experts," often half tramp cranks who drift through orchard sections. This man is responsible for the success of the planting in his charge, and his experience has taught him that the best class of help he can get to work with him at pruning time consists of men who will take an interest in the work and do as he directs, rather than "old fogy experts" who will do their own way regardless of whether it fits the conditions or not. The first question he asks a prospect is, "Are you an 'expert'"? If the man confidently says, "yes," he is not hired.

The first and most important thing for the tree pruner to have in mind is an ideal tree, when it is grown and bearing. There must be a realization of the reason for cutting back branches that this is to make strength in the limbs when they have to bear the load of the superstructure of fruit leaves and branches, and one must know that of all the branches that grow the first year only three or four must be saved, for otherwise the head of the grown tree would be so thick and dense that foliage would be too heavy for any fruit to grow therein, and that the next limbs, two or three on each lower branch, must be built up and out so as to give symmetry to the tree and provide the greatest possible bearing area so that the sun can have access all around, and still maintain a maximum of strength.

An Easterner's Observations

Mr. J. H. Hale Submits Genial Observations Made Upon a Trip to This State a Few Months Ago

AT the close of the Fruit Growers' Convention at Los Angeles in November I made a trip up your great state and on into the apple regions of Oregon and Washington, arriving home in early December more than ever impressed with the agriculture and horticulture of the Pacific Coast and the unbounded hospitality of your people, and I can assure all that here at least is one cold blooded Eastern Yankee, who does not have to eat ice cream to warm him up to an appreciation of California and her people. If you did not live so pesky far away I surely would come and see you more often.

Have just been reading in your issue of December 17 Mr. Roeding's extremely interesting and practical peach article and am stimulated thereby to chip in a word myself, realizing, of course, that Mr. Johnnie-on-the-Spot Roeding knows far more about California conditions than I possibly can.

In the matter of peach tree pruning he is absolutely right; everlastingly pruning, pruning thoroughly each and every year, building broad spreading, low headed trees, with plenty of new fruiting wood each year, and then a thinning out of the fruit so that maturing specimens shall be at least six inches apart, is essential to the securing of full sized, high colored, full flavored, perfect fruit, and such is the only kind that will surely pay a profit year after year, whether it be in California or the East.

Knowing very little of the canning or dried peach trade from the manufacturer's side of it, possibly I ought not to touch upon this subject, but as one who has been a producer of peaches for almost half a century, and as an almost daily consumer of fresh or canned peaches at home or abroad, I long ago became convinced that the canned and dried peach business could be doubled up several times over simply by canning the best dessert eating peaches obtainable, regardless of "color at the pit," and "rag in syrup." Canning and drying for appearance rather than quality has done more than all else to curtail consumption and sale of these products, and when some one comes along with wisdom and capital enough to put up only high class eating products and properly advertises to the consumers, they will do the rest.

The man who eats the product and finally settles the bills must be reckoned with, more in the future than in the past.

For more than 25 years now I have been supplying peaches for a very exclusive cannery whose products sell at extremely high prices; their one and only demand upon me is for peaches of largest size and fine eating quality, never any question as to color at the pit, rag in the syrup and other such foolishness, but it must be size and quality, and then I make the price; never a kick on that and I can assure you I make one that shows a good profit to the producer.

What Mr. Roeding has to say of fuzzy peaches having helped to kill off California trade in fresh peaches in Europe and in the East is undoubtedly true also, yet as most peaches are more or less fuzzy, and some varieties more so in your state than when grown in the East, there has been in the past little help for this situation. Now however that there is a new fuzzless peach also of great size, beauty and superb eating, shipping and keeping qualities, it would seem as though this objection could be done away with, though just how seriously the Georgia and other southern states' peach production may interfere with eastern trade conditions I am not able to predict. However as your peaches are of more lasting quality than those of the Southeast, there would appear to yet be plenty of markets for your peaches if right varieties be grown. Any way if I were living in your state, with all its wonderful peach possibilities, I should expect to keep on growing peaches, and if the old varieties you have been growing do not pay a profit I would try all new ones in sight and originate others if need be to fit the situation. Some way and some how I should expect to grow peaches at a profit. Since my return from the Coast I have had a big, big dream of locating an orchard of several thousand acres in California, planting exclusively of my own pet peach and establishing a cannery for this one peach only; packing for size and high table quality, under orchard name and brand that would show the consumer where to come again when he wants canned peaches that have the real peach flavor, rather than the pale yellow tasteless product now on the market which is a block to what should be an increasing consumption. Probably I am too old or too lazy now to make this dream come true to me personally, yet I feel confident there are others who can and will, and back of it all will come a great revival of profitable peach orcharding in California that will require the product of a pruning shear factory to keep the trees in shape to produce the high class fruit needed. For in closing I still want to insist that the intelligent use of pruning shears is after all the greatest factor in successful peach culture.

Planting Berries and Small Fruits

Observations on Practical Methods by a Practical Small Fruit Grower, Mr. Louis F. Scribner, of Pasadena

DURING these mellow spring days when the call of the ground comes to even the busy housewife, the questions of what, where and how to plant are often discussed and rarely satisfactorily answered. The wise ones have already pruned their orchards and planted such trees and vines as they wished so that they might have the benefit of whatever rainfall there might be; for whatever may be said of irrigation it seems to lack the nitrogenous and beneficial effect of rain upon plant growth.

We have not all been wise ones, however, and the bulk of the planting remains to be done. The nursery catalogues are full of good ideas for the garden and orchard and no one should be without one or more. Plants of many varieties can be used as orchard fillers for two or three years if land is scarce, but it should be borne in mind that there will be a loss to the trees which should be made up with fertilizer if rapid, steady growth is desired. It will be supposed that whatever space is allowed for berry plants, whether in the orchard or a plot by itself, the soil has been worked deeply, subsoiled if possible, and if the rains have fallen since this was done, the surface should be finely worked so as to leave a mulch.

There are numerous methods of planting strawberries. The best for sections where seasons are dry and frequent irrigations are required is to smooth the soil thus prepared and lay off the rows so that water will flow along them without washing. I like to have the rows from 14 to 18 inches apart and not more than 200 feet in length. Plants can be set in the rows from 14 to 20 inches apart, depending on the purpose for which planting is made and the care that can be given. Even for large fields where it might be possible to use a horse in cultivating some such method has been demonstrated to be better than any I have seen.

The plants as they come from the nursery should be carefully unpacked, and if the least bit dry should be soaked in water for an hour or so and set in the soil. If the ground is not

Producing Nursery Stock of Highest

QUALITY

at Lowest Consistent Prices

It is good advice to procure and plant the best nursery stock obtainable,—otherwise results will not be satisfactory. You cannot afford to plant fruit trees of unknown origin, and wait in suspense until fruiting time. A "label" on a fruit tree, stating its kind and quality is not a sufficient assurance for you, before handing out your money for nursery stock. You should investigate your nurseryman—obtain a report on his reliability.

ready for them they should be heeled in carefully. When ready to start planting about a third of the roots should be cut off with a shear or sharp knife. There is no rule for this, but the amount to be trimmed from the roots depends on the condition of the root system. All the old leaves and stems should be removed. With a dibble or trowel in hand and a bundle of plants one may follow the line or mark very rapidly, setting the crowns just above the surface. The soil should of course be firmed about the roots not only at the surface but from the bottom of the hole up so that there will be no air spaces. I have found it good practice to dip a bundle of roots before planting into a syrupy mixture of clay loam, manure and water as this surrounds the roots with a texture of soil particles that clings to them and overcomes in a measure carelessness in planting. If the weather be rainy it may not be desirable to irrigate for awhile after planting, the object of this irrigation being to settle the soil about the roots.

A method I have tried with good results is to make a small furrow on the line of the proposed row, and after irrigating set the plants in the mud, drawing the loose soil about the crowns.

The disastrous experience with the red spider last summer has taught many growers the value of lime-sulphur spray for this pest. The leaf borer needs a little arsenate of lead or zinc arsenite and Bordeaux mixture is a good medium for either of these poisons, the while controlling any tendency toward fungoid diseases.

No poison should be put on plants while berries are forming. If plants are carefully sprayed early there is little likelihood of any trouble during fruiting season. Strawberries like fertilizer, and chicken manure is excellent, especially if some phosphate can be added. The plants should be irrigated at least once a week during the dry season.

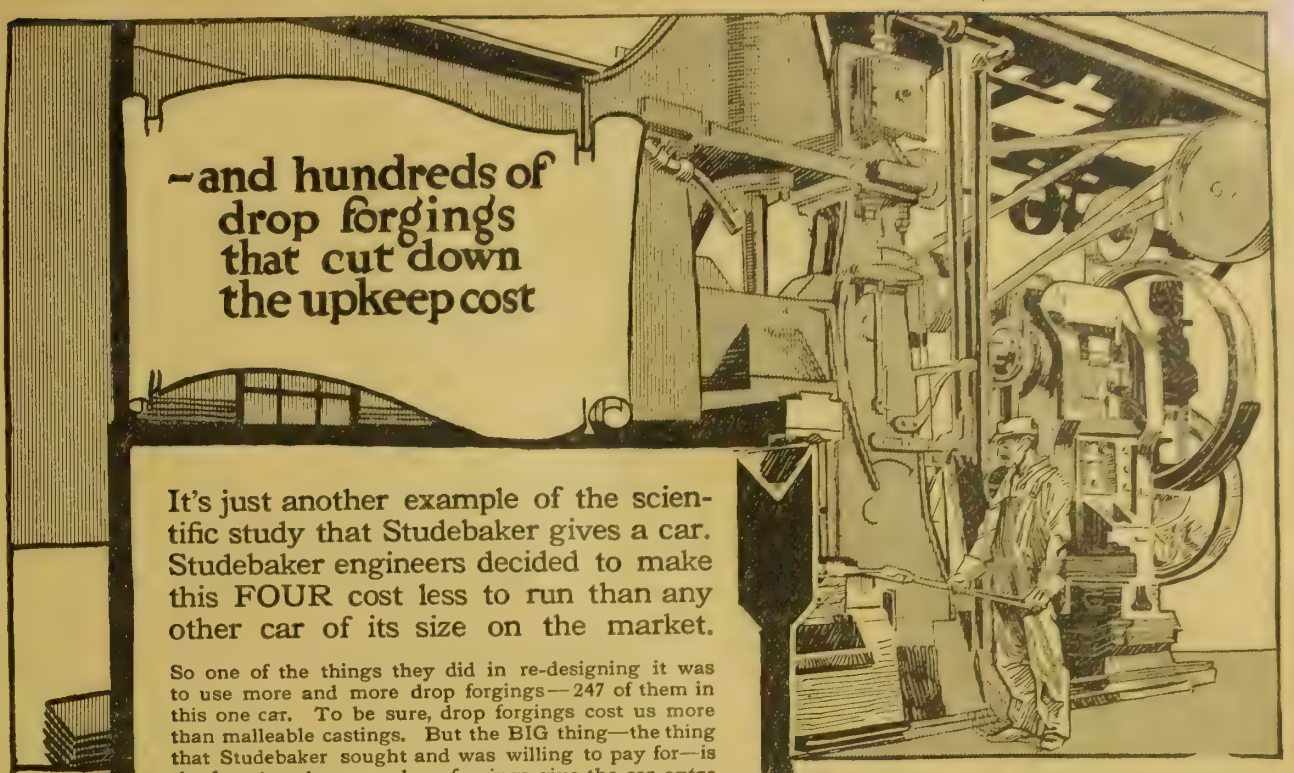
Along with strawberries comes the desire for other small fruits such as blackberries, raspberries, currants, etc. These can be had in straight caned varieties that do not take much room and are easily cared for. What has been said about soil preparation for strawberries applies equally well to other small fruits. The Crandall blackberry seems to be the accepted favorite in Southern California though we have tried other varieties with success. The Mammoth Black is a vigorous climber and needs a six or seven-foot trellis to make a proper showing. The Himalaya is in this class and if kept pruned will amply repay the attention given to it. The earliest blackberries on the market are dewberries, low ramblers of which every garden should have a few.

Red raspberries may be planted two feet apart in rows as desired. Two wires strung on either side of posts set in the row will hold the canes in an upright condition. The canes may be pruned in early spring and fall. The choice in these may be Cuthbert, Surprise, St. Regis or a yellow variety called the Golden Queen. The Red Antwerp is grown extensively in the North. Other names might be given of very good varieties which are not sold by Western nurserymen as yet.

The loganberry has come to stay and increases in popularity every year. I have in my files a letter from Judge Logan written some months before his death telling of his experience in finding the plants that now bear his name.

The loganberry is the blend of raspberry and blackberry, to use popular terms, and for general all-around purposes it is unsurpassed. The field for its use is unlimited save by human appetites for food and drink. The Phenomenal is a Burbank creation along similar lines but partaking of the dewberry type. I venture to say that a Phenomenal berry pie would have cured the Roman epicurean's appetite for canary bird wings. In setting tip plants such as these the roots should be trimmed much the same as strawberries but more care is necessary in planting. The soil should be well settled about the roots with just enough water to do the work.

In field planting the rows are marked and a plow is run both ways in a furrow. If not deep enough a shovel



-and hundreds of drop forgings that cut down the upkeep cost

It's just another example of the scientific study that Studebaker gives a car. Studebaker engineers decided to make this FOUR cost less to run than any other car of its size on the market.

So one of the things they did in re-designing it was to use more and more drop forgings—247 of them in this one car. To be sure, drop forgings cost us more than malleable castings. But the BIG thing—the thing that Studebaker sought and was willing to pay for—is the fact that the extra drop forgings give the car *extra* safety and *longer* life and *rigidity* that makes it EASIER riding—and at the same time, cut down its weight and its upkeep cost.

Of course, that policy of going to any manufacturing expense to make the car BETTER is only what you might expect in a car that Studebaker built. For you KNOW, as your fathers before you KNEW, the sterling integrity and high ideals that name of Studebaker stands for.

But you'll appreciate even more what that name of Studebaker stands for on a car when you see this FOUR at your local Studebaker dealer's—and see how convenience and SERVICE-giving quality have been built into every detail.

It's the ideal car for use on the country roads that Studebaker knows so well—EASY-riding and EASY to drive—handsome as any car you ever saw—and with POWER, lots of it, more than enough for any roads or any hills you'll ever face. And backed by a National Service organization so COMPLETE that wherever you drive, you are "never more than a town away from Studebaker Service."

Why not see this FOUR to-day---this FOUR that Studebaker built to stand the test of country roads? See it and drive it yourself---and judge how much you CAN get for $985

-because its a

should be used to give the plants proper setting. Five to eight feet apart in rows five to nine feet apart is the most approved method. No trellis will be needed until fall or early spring. A lady came to me yesterday and asked for some berry plants for her garden "that would take care of themselves.' I had to confess "there aint no sich animal." If one would have fruit there must be the husbandry. All nurserymen and seedmen worthy of the name are anxious that their goods shall give satisfaction and to that end some maintain a service department to aid the grower in obtaining results.

Planting a Walnut Orchard

J. B. Neff of Anaheim Has Been One of California's Most Successful Walnut Growers He Writes for Cultivator Readers of Planting Methods

TO be successful in planting a walnut orchard the beginning must be made in the nursery. The best walnut trees are grafted, or budded trees, just as the best apple and peach and orange trees are budded or grafted, and the best grafted walnut trees are those grafted with scions from trees producing large crops and on roots which are adapted to conditions under which they are to be grown. The native black walnut has accommodated itself to the conditions of the country and forms a root system much larger than the seedling English walnut, hence is much more likely to be able to support a large tree and to furnish the material for profitable crops of walnuts, consequently makes the best stock on which to graft or bud. There has been considerable discussion as to the relative values of the southern and northern strains of black walnuts for stocks but nothing has so far determined one to be superior to the other. Good deep soil, free from alkali, should be selected in a locality not subjected to late spring nor early fall frosts.

Grade the land to an even slope before planting and lay out the rows with reference to convenience of irrigation rather than the points of the compass. Do not plant trees close unless you are sure you will take out part of them when they begin to crowd each other. If the soil is good the trees should be 60 feet apart at 20 years after planting, because of their size, and if the soil is poor they should not be closer than 60 feet at that time because they will need all the fertility of the square. Select only sturdy trees from the nursery. This will mean those which have not grown too closely together.

Trees should be taken from the nursery with tap roots three feet long and laterals 18 inches long with all the laterals on the tap root, but before planting all the roots should be trimmed smooth at the ends and any bruised or crushed roots cut off back of the bruise.

Dig the holes amply large so that each root can have the position it occupied when growing. Plant as soon as possible after the trees are taken from the ground.

Use the surface soil to fill the holes, putting it in place with the hands so as to be sure the roots are in their proper places, but do not put stable manure nor commercial fertilizers in the holes, either before or during the process of filling. If heavy rains are likely to come soon after planting, leave a slight depression around the tree when filling so the water may gather and settle the soil, but it is better to run a small stream of water along the rows and settle the soil thoroughly, taking care that the trees do not settle deeper than they stood in the nursery and do not settle out of alignment. The walnut tree has an inclination to grow away from the sun, so it is well to lean the tree slightly to the southwest when planting.

One-year-old walnut trees have but a single stem and if they have been taken from the nursery as described above will not need heading back, but if the roots have been badly mutilated they should be cut back to within two to three feet from the ground.

LILLY'S Soluble Sulphur Compound SPRAY

The Sulphur Spray in Dry Form

A Marvelous Success—East, West and everywhere. Manufactured on Pacific Coast under Niagara patents. Advertised and sold in the East as

NIAGARA SOLUBLE SULPHUR COMPOUND

This powerful spray material dissolves instantly in hot or cold water, and, in the long run, there is no better or cheaper spray material.

For the Control of San Jose Scale, Peach Curl Leaf, Blight, Mildew, Read These Twelve Reasons

Why Lilly's Soluble Sulphur Compound is the economical, practical, efficient and convenient spray material for the practical fruit grower:

1—100 pounds of LILLY'S SOLUBLE SULPHUR COMPOUND is equivalent to 600 pounds of commercial lime-sulphur solution. Why pay freight on water?
2—A 100-pound drum of LILLY'S SOLUBLE SULPHUR COMPOUND makes more diluted spray material than a barrel of lime-sulphur solution; reducing the actual cost of material.
3—LILLY'S SOLUBLE SULPHUR COMPOUND is neat and convenient to handle.
4—LILLY'S SOLUBLE SULPHUR COMPOUND comes in inexpensive metal drums, which when empty may be thrown away; no money paid out for barrels; no bother returning empty packages.
5—Its powdered form makes leakage impossible.
6—LILLY'S SOLUBLE SULPHUR COMPOUND keeps indefinitely anywhere, and can be held over from one season to another without loss.
7—LILLY'S SOLUBLE SULPHUR COMPOUND is equal to and has proven many times to be superior to lime-sulphur solution in insecticidal and fungicidal value.
8—A drum of LILLY'S SOLUBLE SULPHUR COMPOUND may be carried in buggy or automobile, making hauling convenient and inexpensive. One man handles it easily.
9—LILLY'S SOLUBLE SULPHUR COMPOUND may easily be obtained in small packages. It is put up in 100, 50, 25, 10, 5 and 1 pound cans.
10—LILLY'S SOLUBLE SULPHUR COMPOUND is cheaper to use than lime and sulphur solution.
11—Will not wash off the trees.
12—Leaves a fine, waxy finish on fruit.

LILLY'S SPRAY BULLETIN No. 30 tells more about this wonderful spray. It also tells HOW TO SPRAY FOR SUCCESS. It deals with spray problems in a masterly way. It is worth many dollars to you. You can have it for the asking.

Go to your dealer NOW and tell him you want LILLY'S SOLUBLE SULPHUR COMPOUND or send to us direct at Seattle or Portland, and we will ship from the nearest distributing point.

1915 To Be The Biggest Year in The 30 Years History of The Fancher Creek Nurseries

Every year since 1883, has seen a marked growth in the size of our stock, improvements in quality, together with greater increased facilities for handling the business that has been so generously given us by our thousands of patrons all over the United States as well as in many foreign countries.

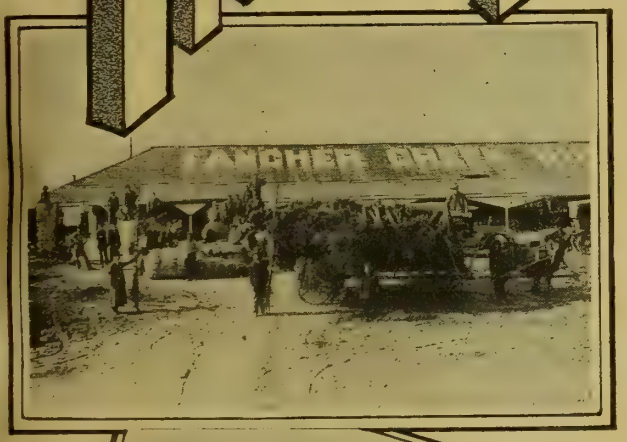
IN THE midst of an extra busy season we wish to pause just for a moment to express our hearty thanks to each and every patron of these Nurseries, for the generous support that you have given us during more than 30 active busy years. We have tried to merit every dollar's worth of business by giving in return the finest, strongest, truest stock that we could possibly grow, and you can be assured in the future of the same personal attention to orders that has proven so satisfactory in the past.

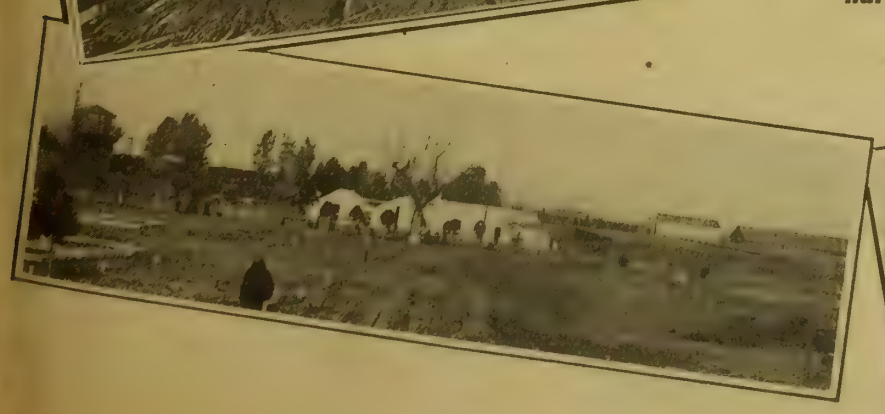
To meet the demands of this big season, which promises to be a most extraordinary year, and a most unusually favorable one for planters, we have grown the most magnificent stock, both in quality and completeness, that it has ever been our good fortune to possess.

Make this big year your big year—the foundation for your future profits—by planting all the trees or vines your resources will allow. But, be sure to plant Roeding's True Trees, if you wish best results.

Big Illustrated Catalog Free

If you haven't already received a copy of our 1915 catalogue—write for it today. It contains brief descriptions and prices of all stock carried by us, consisting of over 2000 different varieties of citrus and deciduous fruit and ornamental trees, plants, vines and roses. We guarantee all stock sold to be true to name and our careful methods of shipping insure safe arrival at destination. Send us your list of what you expect to plant for special prices and suggestions.





Fancher Creek Nurseries

J. H. HALE — America's Greatest Shipping Peach

Firm as a Cling, Yet Perfect Freestone. Round, Holds Shape. Unexcelled for Canning. Rich, Meaty Flesh, Weighs 12% More Than Elberta, ⅓ to ½ Larger, Ideal for Drying. Late Bloomer.

The Peach for Western Growers

Here is a peach that will ship immense distances. A peach round in form and regular in shape, that doesn't "rag out," or discolor syrup, matchless for canning. A peach of sweetness, heaviness and density of flesh admirable for drying. Study these qualities:

Size, 1-3 to 1-2 larger than Elberta
Weighs 12% more per bushel
Tight skin, practically fuzzless
Golden yellow color, carmine blush
Solid and firm. Won't "squash down"
Longer keeper, better shipper
Globular shape for canning
Brilliant clear syrup
Better flavor than Lemon Cling
Heavy, dense flesh for drying
Large size, cheapest to handle
Ripens early—hangs late
Late bloomer, for frosty regions

A few peaches have some qualities best fitted for Pacific Coast conditions. But here is a peach that embraces them all. Find out more about the amazing J. H. Hale. Send for the catalog. Get posted—NOW.

"The J. H. Hale peach trees I bought from you in nineteen thirteen bore fruit this year. Well colored, large, rank, with Elbertas and as hardy to carry as a rubber ball."—A. P. Pleasant, Winters, California.

Be First In Your Section

As an orchardist looking for most profitable fruits, there is a golden opportunity for you in the J. H. Hale Peach. Read the complete story and description in our catalog. Our supply of J. H. Hale peach trees is limited. To get your trees you must order early. Ask about our special June-budded J. H. Hale peach trees for large planters.

Genuine Delicious Apple —Growers' Prices

You who have wanted genuine Delicious can now get them, extra size, extra grade, with the famous William P. Stark quality, direct from our nursery and at nursery prices. Write for catalog showing complete list of tested, profitable apples.

No Agents—Save 30% to 50%

By ordering from catalog you do business with us direct. No salesmen's or agents' commissions and expenses to add to your tree-cost. Note the saving—it figures from 1-3 to ½. All prices printed in plain figures. One price to all. We ship direct to California growers. Our trees pass most rigid inspection. Safe arrival guaranteed.

Genuine J. H. Hale Trees Only From Wm. P. Stark Nurseries

WARNING: Be on your guard against nurseries offering other varieties as true J. H. Hale peach trees. Genuine J. H. Hale peach trees budded from Mr. Hale's bearing orchards obtainable only from William P. Stark Nurseries, Stark City, Missouri. Plant the genuine to make profits certain; shipped direct from us to you for your protection.
None genuine without Mr. Hale's personal signature tag.

Tree Planting Hints

Leonard Coates of Morgan Hill Gives Valuable Planting Hints. Written Especially for California Cultivator

IN size of the hole made in which to plant a tree, the diameter is of more importance than the depth. If the hole were always dug one and one-half feet by one and one-half feet there would not be so much reason for criticism, but it is often much smaller. Two feet wide by one and one-half feet deep should be the minimum size, with bottom of hole convex and roots spread outwards and downwards in a natural manner. In heavy soil a tree should be planted shallow, certainly no deeper than it stood in the nursery; in sandy or light soils it would do no harm if it is set an inch or two deeper. While a tree will often do well if the roots are cut quite close, the fact remains that it is a safer policy to retain all the young fibrous roots that are alive; these are always the first to grow and to sustain life in the newly planted tree. Occasional instances which seem to disprove this should not be heeded, but the general results following what is most widely practiced.

The time for planting deciduous trees in California is any time after the ground can be prepared and dormant trees secured. Usually this is about the first of January. This gives about three months in which to plant, and then let the work be done as quickly as possible, weather conditions being favorable.

A deciduous fruit or almond tree should be not less than two feet from the ground after it is planted, and this may be a guide for heading back. This length of trunk allows for proper spacing of branches which are to form the head, and of which there should never be more than four, preferably three.

The only rule governing irrigation is to see that the tree or plant has sufficient moisture, and to apply water to that end. Extremes should be avoided. Never wait till soil is dry and then "give a bucketful" or flood the land, but add water in the manner most practicable under existing conditions while soil is moist enough to absorb it. In other words, little and often is better than extremes of drouth and flood. A little water applied to newly planted trees in the spring, after rains are over, will keep roots active and do much more good than a large quantity given after soil gets dry and roots have stopped growing.

Cherries should be pruned regularly, like other fruit trees. The main branches can be kept full of fruit-spurs by so doing and if on Mahaleb root, the tree is stockier, and will bear earlier; this root also stands better in uncongenial soil. In deep, alluvial soils, where gigantic trees are desired, by all means use the Mazzard stock, but I prefer a smaller, stockier tree with fruit within sight without the aid of field glasses.

Pears are the best crop on heavy, moist land. The Japanese pear seedling makes an excellent root, and stocks rooted from cuttings of Le Conte as well as seedlings of the Chinese Sand pear are coming into favor, as being more resistant to root aphis. The much maligned nurserymen are up against all these problems and search the world for stocks which shall prove best under all conditions.

Walnut trees need not be treated with any less or more common sense than any other fruit trees. It used to be the inexorable law that a walnut tree must never be cut back or even pruned. Now some say, "Cut them down to near the ground and let them do their growing all over again." Why not be reasonable and treat a walnut tree reasonably? In our own walnut orchard we head back and prune just as we would any other fruit tree, and the results are all that anyone could desire. And for the walnut in California there is no stock better than seedlings selected from our native black walnut, except in shallow or wet lands, where the Eastern Black walnut is more desirable.

Planting Prunes

The Following Remarks Regarding Planting and Care of Fruit Trees are from an Address by E. N. Richmond Before State Fruit Growers Convention at Davis

THE question of planting on the square or triangular system is largely a matter of choice. On the triangular system a few more trees can be planted to the acre. Do not plant your trees too close together. Plant anywhere from 22 to 27 or 28 feet apart. The farther apart you plant, the better opportunity are you going to give the trees to develop into large thrifty trees—they have more air, sun, and room to develop.

Prior to planting, plow your soil and plow deep. Plowing in the orchard business does not mean skimming over the surface of the ground. It means getting down from 8 to 11 inches. This can be done with a disk plow and good stock or through the use of a tractor. Use a subsoil plow and put it down deep along the rows in which you are going to plant your trees, so as to break the under crust and give the young root of the tree an opportunity of easy growth.

During the past few years dynamite has been used in the starting of a young orchard with excellent result by blowing up the hole in which you are going to place a young tree. You loosen all of the soil and give the root every advantage of growth.

Planting for the most satisfactory results should be done either during the latter part of December or through January or February.

The selection of nursery stock is a very important factor toward success. Select one-year-old trees, good clean roots and plenty of them, with a straight top from four to six feet high. As soon as you get your stock from the nursery, heel in the ground in good shape until such time as you are ready to plant, for it must be remembered that the small rootlets are very sensitive to cold or lack of moisture.

Before planting examine the roots closely, cutting off the bruised or broken ends that have been damaged while being handled at the nursery. Examine closely for blackknot or for indications of the peach borer.

Have your ground carefully laid off so that each tree may be placed in its proper position. When you are ready for planting, use the planting board (which is made by taking a one-inch by four-inch piece of wood four feet long, cutting a notch in each end and one in the center), placing it so that the stake which indicates where the tree is to be set will be in the notch in the center of the board and then place a stake at each notch at the ends. Remove the board and center stake and you are ready to dig the hole.

When planting dig a hole deep enough so that when the end of the long root going downward rests on the bottom of the hole the tree will rest two or three inches deeper than it did in the nursery. This means that the point at which the tree is budded is just about on the surface. Very great care should be taken so that the soil is well worked between the roots, using as fine a dirt as possible, and that every root goes out naturally from the tree. If this is not done and

he soil is thrown into the hole carelessly, the roots will all be crowded together to the detriment of the future growth of the tree. Head the tree back to within from one and one-half to two feet from the ground.

Tree protectors should be placed about the young trees very shortly after planting. Tree protectors not only protect from sunburn, but will start the growth in a much more uniform manner, owing to the fact that buds under the tree protectors will not develop, and the vitality of the tree goes toward developing the buds which ultimately make the limbs of the tree.

The most careful consideration should be given to the question of pruning, and here again judgment must be used. Remember you are going to produce fruit for a profit and not wood. At the end of the first year you can commence to mould your tree into shape. About four main limbs from the trunk should be allowed to grow and develop. These limbs should be trained through pruning so that the center of your tree is left open for sunshine, air and the development of fruit producing twigs. Judgment must be used as to the number of branches and laterals which are allowed to grow from the main limb. By proper pruning it is possible to bring a young prune orchard into producing from 1,000 to 2000 pounds of fruit per acre at the end of the fifth year; at the end of the sixth from 2000 to 5000 pounds of fruit to the acre. From that time on there is a gradual and steady increase in production as the tree ages. The inside twig wood will be the first to produce. Many growers make the mistake of pruning their orchards only once in every three or four years. A prune orchard should be pruned, not less than every other year, and the grower who trims his orchard each year secures the most satisfactory results. Strive to keep new wood growing and renewing the tree.

BALLED OR BARE ROOTS

A great many purchasers of citrus trees demand that they be balled or taken up with a small ball of earth about the roots. In fact, where shipments are made long distances such treatment is necessary, but where the orchard is planted reasonably near a nursery we believe the planting of "bare roots" is fully as satisfactory. In this way a large root system is secured. We have seen trees taken from the nursery, dipped in a soil grout or thin mud, packed in wet straw and set the same day 20 miles from the nursery without showing a withered leaf. It is more a matter of care than it is a matter of particular method. We have asked Mr. J. S. Armstrong of Ontario as to planting either balled or bare root trees, and he writes:

"Relative to giving you some pointers on planting citrus trees, will say that the subject is rather broad and would require a little time in preparing same in order to make it intelligible. Will say, however, that the balled tree is considered the safer way of handling citrus stock from the nursery to the field, as the roots are thoroughly protected by the ball of earth retained, whereas in bare roots they must be handled very carefully, not allowing the air or sun to come in contact with the roots. However, a bare rooted tree is preferable to a balled tree if same is judiciously handled from the nursery to the field."

SEPTEMBER BLOOM

We have just had the pleasure of eating a most excellent banana apple picked late in December from a tree which had been culled of its entire crop early in September. At that time, however, a number of blossoms were observed on the tree and these set and matured the fruit which was gathered late in December. The fruit was grown on the place of Dr. J. A. Munk near Compton, Los Angeles County. California has some reputation as a fruit producer, but if we can encourage our orchards to give two full crops per year it will materially increase our output. More seriously however we may add that while such abnormal production is of scientific interest it will hardly prove of economic importance, a doubling of the quantity of the one crop may be a possibility through a more thorough understanding of soil, pruning and other conditions.

Olive Trees

Write for a free copy of our "OLIVE BULLETIN". It gives valuable information that should be in the hands of every prospective planter.

WE can supply you with almost any quantity of Manzanillo, Mission and other varieties of fine olives at very reasonable prices.

Our trees are grown under exceptionally favorable conditions in the choicest spots of California. They are strong and thrifty and guaranteed true to name.

ORANGE TREES

We have a splendid stock of Washington Navel and other leading varieties of oranges, as well as all the leading varieties of lemons, pomelos, etc.—grown from buds of select strain, the kind that produce premium fruit.

Free Catalogue

A WARNING TO PLANTERS AND AN APPEAL TO NURSERYMEN

Written for the California Cultivator
By J. W. Garthwaite

A lemon tree which up to the end of its third year had been in a strong and healthy condition, began at that period to turn yellow and lose its leaves. On the theory that there was something wrong with the roots an investigation was started. Just below the surface of the ground a deep cut was found which completely circled the trunk and in the cut was imbedded a fine wire.

It was the wire from the nurseryman's tag, of course. And was it not the heighth of carelessness for the planter to have left that wire there? Perhaps. But consider the man who is planting a few acres of trees. Some are tagged and some are not. Where

WIRED-ON LABELS

The lower engraving shows tree ruined by wired-on label. Upper engraving piece of rawhide on which name or number of tree is written and attached to tree in a way which makes it impossible to cause injury. Photo by Garthwaite.

he sees the tag he, no doubt, removes it. But what of the wires that are left when the tags are broken off in shipment? In many, if not most cases, rusted and dirty, so nearly the color of the trunks as to be virtually invisible, they are left, tightly twisted about the trees, hidden under the ground to inevitably make trouble in the future.

That the tagging of trees is necessary is admitted, but the use of the dangerous wire and wood tag is not necessary. There are others which are harmless, effective and cheap. For example, a strip of tough paper half an inch wide and six or seven inches long with a slit in one end is easily attached, shows the writing well and is no more liable to tear off than the wire.

It is most earnestly to be hoped that planters using wire tagged stock will make very sure that all wires are removed; and that before long all nurserymen will use a safe method of tagging.

Oakland

Safety on the Road—

is assured when you drive the Oakland—whether the road be rough country highway or paved street in the city.

There is lower weight suspension—a low center of gravity that removes dangers of sideway, skidding or turning over.

Yet this *safety* is made possible without reducing the car's road clearance—which is the usual ample clearance. This makes the Oakland the car for any road, therefore

The Car for the Farm

Oakland safety is increased by marvelous strength—coupled with reduced weight.

And in this strong, light car there's a high-speed motor that will make 2500 revolutions per minute with constantly increasing power.

This means speed when you want it—power to climb the steep hills—and the ends of economy served by Flying Wedge Body Lines which lessen wind resistance.

Get in an Oakland and see it perform in a way that proves its points of superiority. Your Oakland dealer is ready to give you a demonstration.

"Sturdy as the Oak"

POTASH

is food for thought as well as for crops this year.

When shipments were interrupted by the war, it was estimated that there was enough Potash on hand in the United States to provide two and three per cent Potash in mixed fertilizers for this spring's trade. Some manufacturers had more than enough for these percentages.

Since then minor sources of Potash have been fully utilized, and additional shipments from the usual source are still being received.

The supply is below normal, but this need not prevent farmers securing some Potash in their fertilizers, nor should it lead farmers to decide not to use fertilizers.

There is no reason to return to the out-of-date goods without Potash, although some authorities may try to "wish" them on us.

We have not used enough Potash in the past. The largest annual import of Potash was only one-seventieth of the Potash *taken from the soil* by our *1914 corn crop* and only one-fifteenth of the Potash lost every year in drainage water.

Spring crops use from two to ten times as much Potash as Phosphoric Acid. Get as much Potash in the fertilizer as possible. A few firms are offering to furnish from four to ten per cent.

There is no substitute for Potash. It may be harder to get just now, but **POTASH PAYS.**

A SUGGESTION TO OLIVE PLANTERS

Written for the California Cultivator

Olive planting has been heavy in California for the past two or three years and there will be thousands of trees planted this season.

To any who are planning to plant olives in heavy soil let us suggest the advisability of hauling sand and leaving a big shovelful or so at the place where each olive tree is to be planted, so that when the tree is set at least a percentage of the dirt placed around the roots will be of this sand or sandy loam. And if the soil is very heavy the bigger the hole dug for the tree and the larger the amount of sand available for mixing with the silt or clay, the better it will be.

This sandy soil warms up quickly with the first bright sunny days of spring and provides better drainage in the tree hole than any heavier soil. The rootlets from the transplanted tree start quickly and are well established by the time they reach the heavier soil outside the area of the tree hole, and by the time they have grown that far they have the strength and impetus to penetrate readily into the more compact and colder root feeding area and are able to take up the nourishment found there.

When once established in it, trees grow rapidly in heavy land. It generally contains a far greater quantity of the elements of plant food than that which is more sandy and consequently is made up of a large per cent of inert silica from which plants can receive no nutriment.

All that is necessary with heavy soils is to work them so as to keep them open and filled with air and to keep up the supply of vegetable matter from the roots of plants of various kinds. This makes bacterial life active, bringing about a large liberation of plant food.

But in starting young trees, to haul in sand, sandy or gravelly soil for putting in the tree hole will be a distinct benefit.

APPLE GROWING IN CALIFORNIA

The California state commission of horticulture is mailing to those interested in apple growing "Apple Growing in California," written by Chief Deputy State Commissioner of Horticulture George P. Weldon. It is a practical treatise designed to cover some of the important phases of apple culture within the state. In his preface Mr. Weldon says:

"The great importance of the apple in our state, the many failures among those who have attempted to grow this fruit, the common opinion that an apple orchard cannot be made a paying proposition, and the hopeless neglect and consequent failure to produce what might be beautiful and profitable orchards, together with a dearth of literature on the subject, are some of the things that induced the author to write this little book. It is published with a realization of its incompleteness and possible errors, but if it will in a small way, at least, serve as a guide to future profitable apple culture in California, the efforts put forth will in no way be regretted."

This is the most complete treatise yet issued regarding the apple in this state. Every apple orchardist should have a copy. It is a book of 124 pages of cultural information. There are 19 chapters, and everything from planting to harvesting and even the treatment for diseases and pests is included. Write State Horticultural Commissioner Cook, Sacramento, for it.

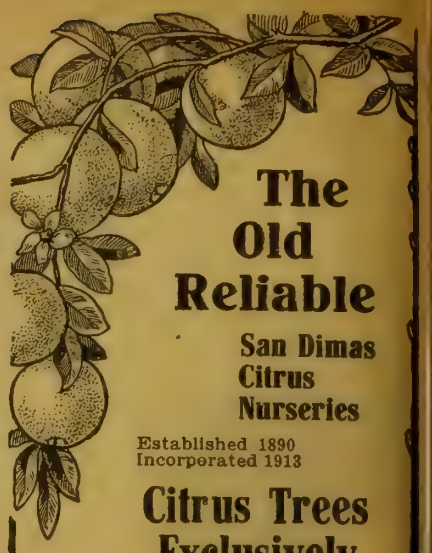
ROEDING'S PRACTICAL GUIDE

We have not yet seen Roeding's Practical Planters' Guide but we venture a guess that it will be true to name as to its being practical. Roeding has the faculty of seeing and of telling what he sees in a way which enables anybody else to reach successful practice. One of the best features of the book is its cheapness for it may be had for 25 cents or, to one who has been or will be a purchaser of Fancher Creek trees it may be had practically for the asking.

MORE FOR YOUR CASH

"It costs more to live now than it did in the old days."

"Yes, but you get more kinds of life."



The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

Teague trees are started right, grown right, and shipped right.

Apple Planting and Early Care

From an Address by C. E. Bremner at a Recent State Fruit Growers Convention

THE planting of an orchard to fit all future conditions is no small matter. First, how far apart must I plant to assure proper root feeding surface? We have seen 12-year-old Baldwins growing in sandy soil and planted 28 feet apart, well shaped and pruned regularly, but whose branches were interlapping. Surely under normal conditions no orchard should be planted closer than this and should vary to 40 feet to suit habits of growth and the congenial conditions of soil and climate. It is better to plant too far apart than too close, especially where the trees are intercropped for the first eight or ten years as is the case in Sonoma County.

The land should be in perfect condition at the time of planting. All subsoil or plow sole should be broken up either by dynamite or a subsoiler, and stumps and forest trees carefully removed, preferably with dynamite, and all roots possible removed before decay sets in, for oak root fungus is a deadly enemy of the Gravenstein orchard, which cannot be cured or even checked, but may be prevented. Apple trees should be planted as carefully as oranges. If in an old vineyard, orchard or grain land, not only should the subsoil be removed, but good top soil placed in the hole, mixed with some well rotted manure.

The young trees should have all broken or partially decayed roots cut back, and as properly spaced in the holes as you expect to train the branches. It is a pretty good rule to clip off the end of each root. Budded trees are always preferable to grafted ones for several reasons; a better root system, less liability to physiological complaints and external troubles. They can usually be planted deeper without placing the union too deep. But whether grafted or budded, do not plant the trees too deep; the union should be just at the surface and never over two inches below. While apples are not so susceptible to ills caused by deep planting as stone fruits, yet it does work against their proper development and often causes distress. A grafted tree is apt to send out numerous small roots around the calice, which forms an ideal condition for a severe attack of wooly aphis. It is also a pretty safe statement to say that grafted stock is more susceptible to the attack of crown gall. In passing, it is important to emphasize the value of clean trees at planting. Trees infested with such insects as wooly aphis or flat head borer, San Jose scale, or with root knot, canker or oak root fungus, should not be tolerated. In fact I do not believe they should be treated, for it is almost impossible to exterminate the trouble when once introduced. Commissioners and inspectors are generally too lenient. I do not believe in any form of treatment at the point of entry; absolute rejection or destruction is the only safe rule for infested trees.

In selecting nursery stock we do not favor overgrown stock, either forced by irrigation or fertilization, or two-year-old trees. The medium tree from four to six feet high, straight without a single lateral, is ideal. When planted cut to 18 or 20 inches. The average orchardist measures with his knee and cuts at the bud that comes the closest to that height, which, on the average man, is 19 inches. Apple trees should be protected during the first few years of growth from the direct rays of the sun on the south and west sides. Whitewashing is good, but two shakes placed about four inches from the tree is best.

Cultivate the young orchard, keep a good dust mulch, and never under any conditions plant hay or other feed that is allowed to mature in the orchard. Cover crops turned under are, of course, beneficial if plowed under early enough, but in the case of young trees are seldom necessary and often detrimental. They give rise to attacks by cut worms and other insects as well as attracting moles which do much damage in girdling young trees. In any case, if a cover crop is turned under, plow away from the trees. Always make the first plowing away from the trees. We find a deep rooted belief that plowing to the trees retards their spring development and thus protects against frosts, but this is absolutely wrong; this early plowing does not retard the tree and often gives rise to conditions which seriously injure, if they do not cause the death of the tree. The planting of berries, either strawberries, logans, mammoths, or raspberries, in the young apple orchard is universally practiced and results in a very favorable opportunity for the orchardist. It enables him to make a good living on the land while waiting for the apple trees to come into bearing—in fact, he sometimes makes more on these secondary crops than he afterwards does on his apples. It is not uncommon to have men clear $200 and more per year an acre on these berry crops. On new land, potatoes are usually planted the first year, followed by berries, which are allowed to remain until the trees are from eight to ten years old.

Medium: "Is there any question you would like to ask your first wife?" "Yes, I should like to ask her to give my second wife her recipe for mince-meat."

John Deere Implements

John Deere Spreader

The Spreader with the Beater on the Axle

The beater—the business part of the spreader—and all its driving parts, is mounted on the rear axle. This is a patented feature. You can't get it on any other spreader. The beater on the axle means there are no clutches to give trouble, less than half the parts heretofore used on the simplest spreader, big drive wheels and a low down spreader without stub axles. Only hip high to the top.

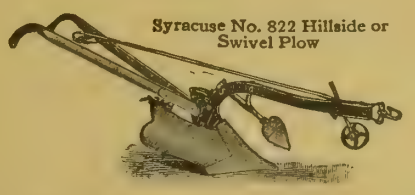
Write for more facts. Also ask for "Farm Manures and Fertilizers", a valuable textbook you can get free.

John Deere Syracuse Hillside or Swivel Plows

Nos. 821, 822, 823, 824 and 825

The Syracuse Chilled Plow Company has devoted over forty years of careful study to the proper shape of chilled plows in order to get proper suction and perfect running qualities. Syracuse Hillside or Swivel Plows have several special features that will appeal to the man who has used other hillside plows—read them over:

1. Do equally good work on hillsides or level land.
2. Option of white iron or hardened soft center steel moldboards.
3. Ample throat room and absence of open joints allow best of clearance.
4. Body securely locked and easily released by means of patented foot latch having adjustable tension.
5. Renewable shoe protects standard and fulfills the purpose of landside.
6. Moldboard of a new design turning furrow up or down on hillside land.



Syracuse No. 822 Hillside or Swivel Plow

Nos. 821, 822 and 823 have automatic jointers or coulter shifters. Nos. 824 and 825 furnished with wheels only.

Write us for information on these plows. We will be glad to send you literature free.

John Deere Wheel Plows

With Quick Detachable Shares

John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

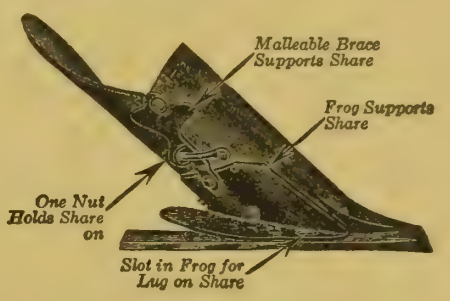
These shares are popular with farmers—they make hard work easy.

Superior Features

Unscrew One Nut—That's All

Unscrew one nut and the share comes off—slip share on, tighten the one nut and you are ready for work.

The share can be removed in thirty seconds and replaced in sixty seconds. Takes from eight minutes to half hour to change old style bolted shares.



Here's what John Deere Quick Detachable Shares mean to you:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang
(High Lift Frame Plows)

John Deere Stag Sulky and Gang
(Low Lift Frameless Plows)

John Deere Two-Way Sulky
(Side Hill or Irrigated Land)

John Deere Engine Gangs
(For Traction Engines)

Write for the booklet above that you want and we will send it to you free.

Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X111

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

JOHN MUIR

The genial face of California's great nature lover, which appears on the cover of this issue of the Cultivator, is from a photo taken by W. E. Dassonville, which appeared in Camera Craft.

FULL MOON

This is not a good potato planting month according to those who plant potatoes "in the moon." Astronomers who have long pencils have figured out that it will be some millions of years, or thereabouts, before another month will come in which there will occur no full moon. So, while we have to deny ourselves in potato planting, we will have a long time to wait before another similar occurrence.

A GREAT SHOW

We are told that preparations are practically completed for the National Orange Show which is to be opened in San Bernardino on next Wednesday, February 17. It will remain open until the evening of the 24th. With California producing the highest grade of fruit it has ever sent out, and in great quantity, with the promise of a successful year to come which abundant rains are now giving, it is announced this will be the most wonderful exhibit of citrus fruits, by-products, and implements concerned with the citrus industry that has ever been held.

SECRETARY OF AGRICULTURE

Assembly Bill Number 164 was introduced by Assemblyman Avey who is chairman of the public utilities committee and member of the agricultural committee of the assembly, on January 13. On January 18 it was sent to the committee and will probably be referred back to the assembly for action. What the recommendation will be or what the action of the assembly will be remains to be seen. The full title of the act is: "An act creating a department of agriculture and creating the office of secretary of agriculture; defining his powers and duties and fixing his salary; providing for the reorganization and consolidation of various departments and the administration of said departments under one head to be known as the Department of Agriculture, and defining the powers and duties of its officers."

This bill, or rather its essentials, was endorsed at the last State Fruit Growers' Convention. We think that as a rule the producers of the state will favor it, but as it makes such a radical change along lines which have been so closely connected with the politics of the state for years, it will without question meet with fierce opposition. Another couple of weeks should show something as to the chances which it has for success.

CHEAP GRAPE FRUIT

Florida grape fruit growers are insisting that the consumer receive more for his money. Grape fruit which is sold in carloads at $2.00 per box advances several hundred per cent before it reaches the consumer, for restaurant and hotel men have a habit of charging 15 and 20 cents for a half fruit. The grape fruit people have induced the diners on the railways up and down the east coast to serve the fruit at ten cents for half and 15 cents for the whole fruit. To secure this change the growers have contracted with large companies to furnish them for the entire season grape fruit at $1.65 per box, f. o. b. Jacksonville. Perhaps California fruit growers can take similar action with some of our California restaurants and hotels. This year is an excellent year to advertise California fruits, but if hotel tables are to be supplied with culls or fruit of inferior quality, and even that at prohibitive prices, the Easterners visiting our great exposition will not go home prepared to demand a continuation of the California fruit eating habit.

ENTHUSIASM

In a personal note which accompanied the article written by J. H. Hale, and which appears on another page of this issue, he refers to the great interest which he felt in reading the article which recently appeared in the Cultivator, written by Mr. Roeding on pruning and general culture of the peach. He refers to Mr. Roeding as being a practical and pushing sort of man whose work he appreciates greatly, and regarding him and the rest of us Californians, he says:

"Like most of the rest of you Californians, he is enthusiastic, and that counts for a great deal, providing you keep it up. We in the far East, who are a little slow and pokey, sometimes have a quiet laugh at your fresh sort of ways, but at the same time those of us who are onto the job know you are right, because you believe in your cause, and that is why we like you."

We believe Mr. Hale is correct as to Californians believing in themselves and in their state. It is born in some, but in some of us perhaps it is acquired with the spirit of the West which is sure to take possession of everyone living here. So, in spite of the quiet laugh which our Eastern friends have at our expense now and then, we doubt not we will continue to show our "fresh ways" and continue to keep California on the map as no other section of the world—outside of Europe—is doing.

RURAL CREDIT

This paper had occasion some time ago to criticize, or rather to use a criticism furnished by the federal department of agriculture of a certain concern in the Northwest which has been advertising extensively its ability to furnish three per cent loans to farmers. The scheme called for the borrower "becoming a member," paying certain dues, and in course of time it was promised the money would be advanced at the three per cent rate. This all looked good, but the loan did not materialize in every case as was anticipated by the would-be borrower. The dominion government finally took charge of the affairs of the concern or at least caused a change in its manipulations, all of which we doubt not was for the protection of the farmer.

There is so much unjust treatment on the part of some banks and money interests that farmers are driven to these concerns, which, if they would consider fully, they would remain away from. As to money loaning, we quote almost entire a letter from a large financial concern in California. It is addressed to the farmer who had made request for a loan:

"In regard to yours of the 4th inst., wanting a loan of $1500 on your ranch, the interest rate in the (section) is not less than 10 per cent and the cost of securing the loan would be at least five per cent. If you will send me a full description of the improvements, together with the legal, we will see what we can do."

Such a proposition shows a disposition akin to that of the thug behind the gun. The concern presumes on having power to hold up a man who is compelled to borrow. In the first place it insisted on its regular ten per cent. Then the cost of "securing the loan" would be at least five per cent. On top of this the "legal" is to be sent before the loan is made. The "legal" in this case was $25 and was to be paid, when the application for the loan was made, for an expert appraiser to visit the land and determine whether the concern would make the loan at all or not. If the loan was refused, as it probably would have been in this case, for we understand that banks as a rule do not loan very extensively in that particular section, then the borrower's $25 would be forfeited. This makes a total of about 17 per cent. No farmer living can lift a mortgage with the products of a farm under such a rate of interest. If the funds of the nation are to be controlled by people of this class, there is abundant reason for more cooperation or possibly more socialism.

Deciduous Planting Notes

Many Practical Ideas by J. W. Mills of Yuba County

THIS is the proper time to plant deciduous trees. Plenty of rainfall after planting insures a higher percentage of thrifty trees.

The customary size for tree holes is two feet wide and two feet deep. This is no rule to follow as the character of the subsoil determines how elaborate the preparations of the soil should be. On a stiff heavy soil with this condition intensified with the depth, a hole four feet wide and deep filled with loose soil would give the young tree a better start than if planted in a hole two feet by two feet. But even in the four-foot hole in such soil a fruit tree will not make the growth that it will in the loose moist loam of some of our river and creek bottom lands even if the roots were crowded into a hole barely large enough to receive them. The object is to make an adequate volume of soft soil in which the roots may grow the first year of the life of the tree and as long thereafter as possible. There is a limit to this artificial loosening and mellowing. By the aid of dynamite this can be done much cheaper and more thoroughly than by hand and the size of the hole made is only limited by the size of the pocketbook.

Blasting Holes

The holes are most enonomically made by driving a pointed bar to the depth desired. Two simple methods are effective in removing the bar from the hole. One is to pry the bar out with a lever. Another way is to hammer it up by means of some heavy weight with a hole in it through which the bar is passed before driving. The weight may be a heavy piece of iron or an iron wheel. For instance, a plow wheel is laid down with the hole in the hub at the point where the hole is to be made in the ground. A collar is welded on the bar a few inches below the top. After the bar is driven in the ground the wheel is jerked up by a man on each side so as to strike against the collar on the bar, driving it out of the ground. This method was invented by Mr. Carnes of the Natomas.

Where hardpan is encountered a chisel-pointed bar is the best tool. With plenty of water and a mud-spoon, rapid progress is made. In ordinary soil half a stick of 25 per cent dynamite at a depth of three to four feet will do good work. Nothing short of one stick will be effective where the hardpan is five or six inches thick. The powder should not be placed entirely below the hardpan. When placed just at the lower edge of the hardpan it fractures it sidewise and lifts it at the same time. A charge properly guaged will lift the mass so that it will fall back and fill the hole. Too small a charge will bulge out a cavity which must be opened up and filled by hand. A charge that blows all the dirt out is either too large or insufficiently tamped. Water should be turned on at the time of planting to settle the soil clear to the bottom of the hole.

Pruning

It is immaterial whether the tops are trimmed before or after planting. There is less chance of injury if the tops are cut after planting. The newly set trees should be headed to about two feet. This leaves the branches above the frame of the cultivator and barking of the limbs is avoided. When the trees have developed lateral branches in the nursery, that are properly placed on the stem, use should be made of them when pruning at planting time. To be properly placed they should be distributed as far apart on the stem as possible. This is not so essential with peaches as with other fruits.

The pruning of the first season's growth in the orchard should be confined to establishing a good crown for the top of the tree. Not more than four branches, preferably three, should be left and cut back to about eight or ten inches.

Roots

Stone fruits, other than cherries, are usually grown on peach root where soil conditions are favorable to it. Peaches should not be planted where soil conditions are not congenial to the peach root. Peaches on apricot root will bear much heavier and younger than when on their own root. Though most apricots are grown on peach root, apricot root is often used with good results. Perhaps the only objection to it is the fondness gophers have for it. Cherries are budded on Mazzard and Mahaleb root. The former is used in this state almost exclusively. Prunes and plums should be grown on Myrobolan root where moisture is liable to be excessive, but on well drained soils, peach is a good root. Pears and apples are grown on their own roots except when it is desired to grow dwarf trees. For this purpose quince is used for pears and Paradise for apples. Doucin roots are used for half dwarfing apples.

Agricultural News Notes of the Pacific Coast

Northern California

Yolo County dairymen met at Woodland last week.

Several Sutter County orchardists are planting pecans.

A few farmers of Sutter County are testing out licorice growing.

Mendocino County farmers are working to secure a farm adviser.

Yuba County producers are holding 25,000 sacks of rice for higher prices.

Richvale, Butte County, is planning a reclamation district for a 40,000-acre tract.

Waste basin lands, to the extent of over 70,000 acres, are to be reclaimed in Sutter County.

Orange growers of Fairoaks, Sacramento County, are organizing a cooperative marketing association.

Hop men of Ukiah, Mendocino County, are contemplating plowing up hop acreage and planting wheat.

Glenn County has purchased right of way for a new road through the eucalyptus farm at Germantown.

Dairymen at Gridley, Butte County, are gratified at results of the cow testing association organized there some months ago.

A department ruling authorizes the grazing of 1,000 cattle and horses, 25,000 sheep and 5,000 swine in the Shasta national forest.

The Yolo County Dairymen's Association has decided to take over a large creamery at Woodland and operate it cooperatively.

The California Fruit Exchange of Sacramento has given growers shipping through it another dividend on last season's grape shipments.

The Glenn County Commission, having in hand the preparation of exhibits for the expositions at San Diego and San Francisco, has a force of men at work picking and packing oranges at Orland. The fruit is wrapped in attractive papers advertising the county and the government irrigation project, as well as the grower. The fruit is to be given away at the expositions to advertise the citrus possibilities of the section.

Central California

Visalia recently made its third shipment of mules to the Hawaiian Islands.

The San Joaquin Counties' Association is installing a great exhibit at the Panama-Pacific.

It is estimated that over 2,000,000 ground squirrels were destroyed in this state during the past year.

The planting of orchards will be immensely increased around Hollister and other San Benito County sections.

The Green Fruit Association at Fresno is still agitating for a more general movement for standardizing fruit output.

The Associated Raisin Company has purchased all the holdings of four large raisin packing concerns of Central California.

A bill has been introduced in the legislature to remove protection from black birds and robins because of their destructiveness.

Professor Dougherty of the state university made an address before the recent meeeting of the Visalia Cooperative Poultry Association.

The Merced County Swine Breeders' Association was recently organized. Its principal object will be a well organized fight against hog cholera.

Lands in Kern County, valued at $10,000,000, which had been secured by railway companies through what the government charges to have been fraudulent representations, have been returned to the government.

Turlock melon growers are joining with other producers of Stanislaus County and are working for the State Produce Exchange and for any movement which will enable them to command living prices for their output.

A meeting of raisin growers was recently held at Dinuba to discuss the matter of membership in the California Associated Raisin Company. Five year contracts were signed by the new members.

The Tulare County Poultry Association closed the last year's operations, according to report at the annual meeting, with a total business of over $60,000. The cost of operating was somewhat less than $2,500.

Southern California

Los Angeles County has planted miles of roses along its roadsides.

The Hemet Agricultural Association is discussing methods of spraying.

February 6 was flower planting day at Santa Maria, Santa Barbara County.

Sugar beet sections generally report sufficient seed on hand for the coming season.

Walnut growers of Simi Valley, Ventura County, are planning a marketing association.

Fullerton's chamber of commerce has received propositions looking to the establishment of a cannery.

The anniversary of the navel orange will be celebrated at the National Orange Show, February 17 to 24.

The Imperial Valley Poultry and Produce Association is growing rapidly. It already has 200 members.

Farm Adviser Parker of Ventura County reports most effective work in squirrel poisoning throughout the county.

In its annual estimate of the orange and lemon crop of the state for the coming season the Riverside Press forecasts an output of 43,950 cars.

An Orange County citrus grower was seriously burned by the explosion of a frost fire pot filled with distillate, which he was endeavoring to light.

State Highway Commissioner Stern has prepared a definite plan for using convicts on the state highway. This will be submitted to the legislature for formulation into a bill.

Eighty Japanese cantaloupe growers of the Imperial Valley have filed suit in the United States district court against commission merchants of New York, Pittsburg, Chicago and Los Angeles for defrauding them of just returns from their melons.

The National Orange Show, to be held at San Bernardino February 17-24, has inaugurated a new feature in judging contests by students of schools in the state which have horticultural courses. Dr. H. J. Webber of the citrus experiment station is in charge of the contest.

The Coast

February 5 was observed as arbor day in Arizona.

Arizona ranges report almost complete cessation of imports of feeder cattle from Mexico.

Farmers near Phoenix, Arizona, are moving for the establishment there of a demonstration farm.

Arizona cattlemen are supporting a bill authorizing the granting of bounties on wolves and lions.

Montana agricultural college has installed a professor of horticulture and more attention will be given to instruction in fruit culture.

Farmers attending the state short course at the agricultural college of Arizona are reporting intensely interesting and instructive lectures.

Farmers short courses ended at the University of Idaho last week. The attendance was very large. The housekeepers' courses were an especial feature.

Governor Withycombe of Oregon is urging investigation of possibilities of flax growing in that state and the installation of a flax factory in the penitentiary.

Many coyotes have been shot near Vale, Oregon, which have been found affected with rabies. The disease is being conveyed to dogs and live stock of that section.

The quantity of corn which will be planted at Lapwai, Idaho, will be much greater than any preceding year. It has been found a most profitable crop in that section.

Some of Oregon's legislators are proposing to wipe out a state expenditure of over $50,000 by abolishing the state livestock sanitary board and the office of state veterinarian.

Oregon is having a mad coyote scare. State Bacteriologist Saurman reports conditions in affected sections more serious than reported. Many dogs and cattle have been infected by the coyotes.

A bill is before the Oregon legislature, urging the appropriation of moneys for irrigation investigations in that state. It is suggested that nearly a half million dollars be set aside for the work of the first year.

Kirkman's Reliable Trees

Make Horticulture Profitable

Our stock of fruit trees in several of the leading varieties will be entirely exhausted before March 1st. We hope to be able to supply at least all of our old customers with what they will need. Write us at once please, letting us know what varieties you expect to plant. We want to supply you if we can.

Kirkman Nurseries

2519 Tulare St. FRESNO, CAL.

YUCAIPA VALLEY

"Where the Big Red Apple Grows"

San Bernardino County

Eight Miles from Redlands

Many of the young apple orchards in this wonderful valley will produce fruit this year. Land suitable for the apple in Southern California is not to be found outside of this valley, and among the owners are men who spent many years in the northwestern part of the United States. Why did they come to the Yucaipa Valley? Because the altitude (2600 to 3000 feet) is the best for producing winter apples that have the keeping qualities. The best method we have of proving this is to take you to Yucaipa and show you. Many level acres on the South Mesa at $285 per acre, including one share of water stock. This is the time of year to plant trees. Call on or write

Redlands & Yucaipa Land Co.

DIKE & LOGIE, General Sales Agents

209 Orange Street REDLANDS, CAL.

THE GARDEN

Written for California Cultivator
By Ernest Braunton

NOW is the time to garden and garden intensively. Every day is valuable, for the most active season is upon us. Now that we have had heavy rains warm weather will follow, every dormant plant will start into action and he who gardens will have to rush to keep up with the vegetative progression.

First get rid of all the rubbish you can find, either through burning, burying, or composting. All sorts of rubbish provides fine places for harboring insect pests and fungus diseases, and if this rubbish is burned all will perish, even eggs and embryo insects.

Rose bushes will now begin to send forth new growth whereon to support the spring crop of blossoms, and this activity of new growth will continue through March. If you have not pruned yet do so at once but pass by double and single Cherokee, Beauty of Glazenwood or Gold of Ophir, the white and yellow Banksia, as their bloom is produced all along the branches and if you cut off these you cut off flowers. Prune these at close of flowering period in the spring; they then have all summer in which to grow long branches for the next season's bloom.

Fertilize lawns now for heaviest rains are doubtless past and much of the food supply will remain on the land. Also frost danger is largely over so that new and tender growth will not suffer a check. While natural manures are best, the possible danger from weed seeds contained therein bids us hesitate. If stable manure has been wetted and turned over several times so that weed seeds have been started into growth or burned, or both, it is safe to use. Otherwise the use of commercial lawn fertilizer is advised.

Break up old clumps of chrysanthemums and root tips in sand, or divide into small pieces and transplant. Also sow seeds for many hardy annual and perennial plants. Some of these are: Asters, phlox, dianthus, salvias, stocks, etc. Plant gladioli and other hardy summer flowering bulbs. Tender bulbs, as begonias, are best left until later, also seeds of the tender annuals. Get busy and keep busy. Now is the season of garden activity upon us.

The Downy Coffee Berry

From Merced I have just received a sample of the Downy Coffee berry plant, Rhamnus Californica var tomentella. It is superior in general appearance to the normal type or species found farther south, and the two together or in contiguous zones in massing make for varied landscape beauty. I do not know that this variety is on the market yet but do know of a nursery firm having acres of it on a ranch and am advising them to get some ready for sale. In the South the species type finds a ready market.

Our Wild Fuchsia

All through the summer there has been blooming, throughout much of California, a lowly, small-leaved shrub having brilliant scarlet pendent flowers much resembling fuchsias. The popular name is California Hummingbird flower, rather too long for practical use. This shrub is one of the most drouth-resistant of California native plants, flowering without water supply throughout our long summers, a truly splendid recommendation. At time of first autumn rain they may safely be moved if cut back to six inches high and shifted quickly.

The Bauhinias

In looking over an illustrated catalog of the plants in the botanic garden at Buenos Ayres, I find a number of species of bauhinia. Some of these we grow, some we do not, yet all are good that thrive in local territory. All we grow become small trees except one, B. Galpini, and why this most excellent shrub has not become more than ordinarily popular I do not know. Possibly it has proven too tender for California in general, but I have seen it at Santa Barbara, a solid mass of

TRUE TO NAME

"Behind ... is O...

SILVA-BERG...

Our buds are selected for propagating only from parent trees having the best record for quality of fruit and productiveness, thus insuring a pedigreed tree and a tree that is true to name.

The time to plant Fruit Trees

IS NOW

Look over this list—it shows the number, size and price of each variety available at this date.

Fruit growers are fast depleting our stock, so we would advise an early selection or it will be impossible for us to fulfill your wants. Our list shows how low our stock is. By ordering now we can make immediate shipment of TREES TRUE TO NAME.

We specialize on foothill grown stock for hardiness, good, well branched roots, freedom from root knot and disease.

They are superior to those grown in any other soil or location.

Order today, if possible.

A special discount of 5% allowed for cash with order.

ORANGES, LEMONS AND POMELOS

For pleasure, attractiveness and profit, nothing will enhance the value of your home or ranch so much as a dozen or more well-kept citrus trees. Oranges, Lemons and Pomelos can be successfully grown in every section of California up to an altitude of 1200 feet. NOW IS THE BEST TIME TO PLANT. We have a fine lot of trees in all varieties, on which we are prepared to make immediate delivery.

Prices on All Varieties

	Each	10	100
⅝ to ¾-inch caliper, balled	$1.25	$11.00	$80.00
½ to ⅝-inch caliper, balled	1.10	10.00	70.00

Prices are F. O. B. Newcastle, with a nominal charge for boxing.

...HOLDT Co.
...ALIFORNIA

brick-red blossoms. The other species are also good but will not stand heavy frosts.

Charm of Water

If I lived in the country and needed a reservoir for strictly irrigation purposes, not for domestic water, I would make it ornate and embellish it with plant life. It will cost but little more than a circular or square reservoir and prove, if rightly planted, "a thing of beauty and a joy forever." Water in natural streams or bodies is so scarce in California, especially in the southern end of the state, that it holds a charm for mankind above that of any other inhabited section of the United States. On the farm, where utility is the first demand and the foundation of all things, it is as well to determine how we may also provide beauty and combine the two in one harmoniously and without great additional cost.

Special Eucalyptus

Though the eucalyptus craze has come and gone, so far as heavy commercial plantations are concerned, let us not forget that these still have many uses on the farm, both economic and ornamentive. There are so many species, adapted to so many special purposes (aside from the general timber species), that one should give them some thought before planting indiscriminately. If landscape beauty is in view it may be as well to avoid planting species which make but poles or gigantic exclamation points on the local outlook. Yet nearly all make umbrageous trees if standing more or less isolated, as single specimens or in groups of a few trees.

Live Oak

The more I plant and observe live oaks the more I believe in planting them freely everywhere, especially upon streets. When less than ten years of age they are not especially impressive but after a decade of growth, even if not well cared for, they have developed into beautiful umbrageous young trees. It is my candid opinion we should plant more of live oaks everywhere and see that they are watered frequently and heavily throughout the summer, for upon water depends their rate of growth.

The Shrubby Grevillea

The cold snap of January 1913 removed many fine specimens of the scarlet flowering shrubby grevillea, G. Thelemanniana. But previous to this time it had enjoyed an uninterrupted run of a dozen years and had become both popular and common. For dry localities it is especially good and should still be freely planted for it has many good points to recommend it as an ornamental. In fact, it has no superior that I now recall.

CHANGING PLANT SEX

Written for California Cultivator
By Ernest Braunton

The following is submitted without comment. The United States department of agriculture in 1914 issued Bulletin No. 32 of the Hawaii experiment station, entitled: "The Papaya in Hawaii." On page 26 occur the following statements:

"The complete change of a male tree to one purely female, with fruits of the form of the ordinary dioecious papaya, is perhaps the most remarkable. A well authenticated case of this character has been reported and the tree in its present state has been examined. * * * Dr. John T. Gulick, a scientist of wide reputation, whose studies in evolution published by the Carnegie Institution would alone be sufficient to establish his accuracy of observation and statement, has kindly furnished this station with the history of this tree, which has grown in his garden:

"'When the tree was a year and a half or two years old, it had produced only staminate flowers. It was then six feet high, and we cut off the leaves and the top of the tree, that were in the way of a clothesline. It was not till many months later that we noticed that the new branches were bearing fruit and that the flowers were all pistillate. During the three years that have passed since its head was cut off it has developed ten branches * * * all of them producing pistillate flowers and fruit.'

and fruit.'" (Signed) John T. Gulick.

What Those Who Know Say About Ideal Green Feed Silos

San Luis Obispo, Jan. 28, 1915.

De Laval Dairy Supply Co.,
San Francisco, Cal.

Gentlemen:—

We are anxious to tell you of the good results we are having since erecting an Ideal Green Feed Silo. The corn we put in is coming out perfect silage, **no waste and good to the very edges.**

This amount of feed, for as you know we erected a silo of two hundred tons capacity, is going to practically **double the income of our dairy.**

We raise a great amount of feed in the shape of corn on a comparatively small acreage for the silo, giving the extra land to raise grain, thus **cutting the expense of mill feeds to a minimum.**

We can honestly recommend this Ideal Green Feed Silo to any dairyman and firmly believe a silo will prove very beneficial and remunerative to our coast dairymen. **It is an insurance policy that makes its own payments and pays the amount of the policy in a short time besides.**

Sincerely,
SINSHEIMER BROS.

AN IDEAL GREEN FEED SILO WILL DO AS MUCH FOR YOU

Live Stock and Dairy

SILOING ALFALFA

SUCCESSFUL experiment made made last season by the experiment farm of the University of California at Davis in putting the first crop of alfalfa, which was heavily mixed with foxtail, in a silo and feeding the silage to stock to fatten them for market, was of great assistance to the farmers, dairymen, and stock raisers of California, for it proved beyond doubt that the first crop of alfalfa, which has heretofore generally been discarded because of its mixture of weeds and foxtail, can be successfully used and saved.

Instead of throwing away this first cutting of alfalfa it should be cut while the alfalfa is in bloom and before the foxtail is too dry, run through a cutter, put into a silo and allowed to cure. After three weeks or a month in the silo it can be fed to beef cattle or dairy stock with exactly as good results as silage made from the later cuttings of alfalfa or from corn and alfalfa mixed.

In order to take advantage of this plan, farmers contemplating its use should begin to build their silos so as to have them ready for this first cutting before it is too dry.

The value of this method is not only the saving of this first cutting of alfalfa, which has previously been of no value, but the increase in the weight of the beef cattle and the milk flow in the dairy stock during the hot summer months.

A silo can be filled with this first cutting of alfalfa, emptied, and again filled in the fall either with the last cutting of alfalfa or with a corn crop, or a mixture of both. In this way a farmer would practically save the cost of his silo the first year.

Several of the largest hog raisers in California are now feeding silage to hogs with splendid results. The Huston Farms at Winters have two redwood stave silos which are used exclusively for hog feeding, and the results of their experiments in this line have been so successful that they are contemplating more silos.

It would pay the California farmers who do not now possess silos to investigate the points mentioned above thoroughly and carefully.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Period of Gestation

Will you please tell me when is the proper time for a mare to foal that was bred on April 11, 1914? Just one of our mares last year went full 11 months and I was not sure of the exact time they should go before foaling. They are range mares that run out most of the time with only mountain pasture for feed.—Subscriber, Santa Maria.

The period of gestation of the mare is given as 11 months, but mares vary oftener from the regular time than any other animal. They usually go the full 11 months and often run over two to four weeks. You may know when they are about ready to foal by wax appearing on the ends of the teats.

Diarrhoea

I have a three-year-old colt that for the last three months has had frequent evacuations of liquid manure. Sometimes the diarrhoea is so bad it seems to be half liquid. I am feeding her good alfalfa hay. She gets good water. Her teeth are good and she is in good condition. What can I do for her?—Subscriber, Kingsburg.

Alfalfa seems to give some horses the diarrhoea and more especially when it is cut green. When alfalfa is intended for horse feed it should be allowed to mature so the stalks are dry when made into hay. You had better feed oat hay part of the time. Medicine will be of no benefit.

Lumps in the Skin

I have a mare nine years old that has hard lumps on her about half an inch in diameter. They seem to be a thickening of the skin and do no harm except that where the harness rubs they become sore. What will remove them?.—Subscriber, Santa Rosa.

Give her a handful of epsom salts in the feed once a day for a week. Then get a pint of Fowlers solution of arsenic and give half an ounce once a day for three or four days; then one ounce a day for ten days, and finish the bottle by giving half ounce doses daily while it lasts.

Scours

What can I do for some eight-months-old heifers that have the scours? They are on grass and are fed oat hay.—Subscriber, Gualala.

Probably the new grass, being full of water, is the cause of the trouble. If it lasts too long get the following powders: Tannic acid one ounce, powdered gentian four ounces, powdered nux vomica two ounces, bicarbonate of soda four ounces and enough farina to make one pound. Mix and give each a desert spoonful once a day.

Bog Spavin

Have a three-year-old mare that has not been worked yet but has a bog spavin. Is there any cure for it? Would like to breed her. Would the bog spavin have any bad effect on the colt?—Subscriber, Gualala.

Colts from mares affected with bog spavin are more likely to have the same trouble than those from perfectly sound mares. In this case it may have been caused by an accident which would make it less liable to be

Improve the Cows You Have!

Hundreds of "backward" cows that are sold for meat ought to be kept in the herd. Most of the poor milkers are non-productive because their system is run down. They need medicine that will tone up the sluggish organs of digestion and enable them to thrive and perform their natural functions of production and reproduction.

KOW-KURE, the well-known cow medicine has for over twenty years been making good producers out of backward cows. It is a tried and proven remedy for the prevention or treatment of such ills as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring and Lost Appetite.

Try a package of **KOW-KURE** on your poorest milker and note results. It is sold by druggists and feed dealers in 50c and $1.00 packages.

Write us for valuable free book, "The Cow Doctor."

transmitted to the young. Feed sparingly and reduce the flesh. Use the following ointment on the spavin: Iodine tincture one ounce, iodine crystals one dram, lard oil four ounces. Clip off the hair and once a day apply some of the ointment. Rub it in well.

Indigestion

I have a heifer about two years old due to freshen in two or three weeks, in good flesh but for some time she seems to breathe very hard at times. I can hear her breathe two or three hundred feet away but at other times she breathes naturally. I feed alfalfa hay and ensilage. What can I do for her?—Subscriber, Gardena.

Probably the trouble is due to overeating. Watch and see if she is not bloated some when she breathes hard. Reduce the quantity of feed and give the following: Aloin three drams, turpentine two ounces and enough raw linseed oil to make one pint. Mix, shake and give at one dose.

Stomach Worms

Kindly advise me what to give a horse for intestinal worms. They are quite large and are nearly as thick as a lead pencil and taper to a point at both ends. I noticed one with a protuberance about the middle from which dangled a mass of thread-like matter that evidently were young worms.—Subscriber, Exeter.

Overfed horses are usually infested with worms. First reduce the feed and give the feed regularly; not over a pound of hay in 24 hours to each 100 pounds weight of the horse. Get of your druggist: Aloin three drams, turpentine four ounces and raw linseed oil enough to make one quart. Shake well and divide into six doses. Give one dose every other day. Another good remedy for worms is to mix three parts of salt with one part of wood ashes and give a tablespoon in the feed once a day.

Melonotic Tumors

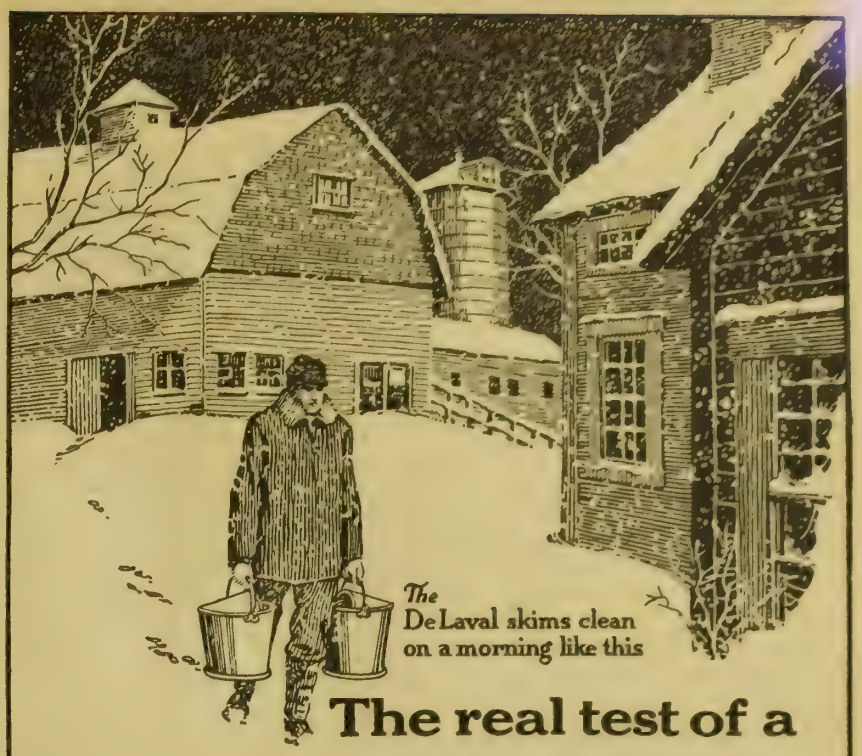
I have an old white mule that has a tumor on one side of the body and also a growth imbedded in the muscles of the breast which, according to a local veterinarian, presses on a nerve which causes a partial paralysis of her fore leg. He thinks it is caused by the black pigment of the hair gathering and making a tumor. The tumor on the breast is quite deep. Do you think it advisable to have it operated on or will an absorbent do any good?—Subscriber, Exeter.

As gray animals grow old and become whiter from year to year the black pigment that the system has been secreting to color the hair may gather in lumps and form what is called melonotic tumors. No one can say that the lumps or tumors of your mule are such or not without having opened them. The tumor on the breast is more likely to be a cold abscess. In those the pus is very deep. It should be lanced deep enough to reach the pus but in no case should any of the flesh be cut out. After opening it, if pus is found, the cavity should be dressed once a day until healed with a solution of carbolic acid; one part to 16 of water.

Thrush or Canker

I have a horse that has deep holes around the frogs of his front feet. When I have cleaned them out a very strong and disagreeable odor is noticeable. He walks a little lame. Would this disease cause the lameness? What is the best treatment?—Subscriber, San Dimas.

The trouble with your horse's feet may be thrush or canker. The latter is very hard to cure. Remove the shoes and poultice the feet over night with a poultice made of bran and hot vinegar. Next day clean out the holes and scrape out everything that does not seem to be healthy tissue. Then pack the holes full of cotton soaked in a solution of one ounce of chloride of zinc to one pint of water. Wrap the feet with something that will keep the packing in and change this every day or two until you think the disease is entirely stopped. Then fill the places with cotton or oakum soaked with equal parts of tar and vaseline. Cover this with a thick piece of leather and put the shoes on. When he needs to be reshod the feet will probably be all right.



The real test of a cream separator

SKIMMING cold milk, or milk from stripper cows, or both, is the real test of a cream separator. If your separator is small, necessitating a long run, it's still harder to skim clean in cold weather.

The De Laval is the only cream separator that can be depended upon to do good work under such conditions.

That is largely because of the exclusive patented "split wing" feeding device in the De Laval bowl.

This delivers the incoming milk into the separating bowl between the discs **beyond the cream wall** so that there is no remixing of the cream with whole milk, as in the bowls of all other separators.

For this reason the De Laval will skim clean under the very hardest conditions, whereas other machines which may do fairly good skimming under favorable summer conditions are the worst kind of "cream thieves" in winter.

A De Laval catalog, to be had for the asking, will explain fully why the De Laval can be relied upon to do good work under any or all conditions, or the local De Laval agent will be glad to explain to you this and other reasons for De Laval superiority.

Poultry for Profit

POULTRY AS AN ADJUNCT TO FRUIT GROWING

By J. E. Dougherty

As the tide of population has moved westward it has steadily pushed the frontier, that great boundary line separating the new and virgin soil from the land under tillage, farther and farther and finally dumped it into the Pacific ocean. Now the new farming land is practically all taken up by settlers, yet the population of our country continues to increase from within, and a steady stream of immigration from Europe and Asia is flowing to our shores.

Within the last decade we have come to strongly realize that methods of farming have got to become more and more intensive if our food supply is to keep pace with the increased demands as a result of an increase in population. Agricultural education has received its greatest impetus in this last decade because of the need for more exact and detailed knowledge in the successful management of intensive farming. The very words "extensive" and "intensive" significantly express the difference between the two types of farming. We can no longer take up a piece of virgin soil, work and exhaust the vitality and fruitfulness and profit of it by indifferent and careless methods and move to another virgin piece. We have no more virgin soil to squander; it is all gone; our frontiers are gone. The numbers of people who want land are steadily increasing, but the limit of our agricultural expansion over new lands has been reached. From now on our attention must be turned to the more efficient use of the land we now have, which means the cutting up of large ranches into small holdings that will be intensively farmed and their productivity most zealously conserved.

Five, 10, 15, 20 and 40 acre farms are going to become more and more common in this state. The great ranches will gradually disappear as more people come here, and transportation facilities, such as good roads, steam and interurban roads and (last but not least) low-priced, substantial autos, increase and render traveling facilities between all points in the state quicker and less expensive.

The type of farming on the small ranches, because of the very economic fact that the owner cannot better himself by moving since there is no other land of equal value to be had cheaper, and because the highest productivity of the land must be secured and conserved so that worth-while profits may be secured at once and continue to be secured in the future, requires scientific knowledge and a thorough utilization of every resource.

Poultry as an adjunct to orcharding represents one of the means by which the orchards can be more thoroughly utilized. If this is true, why should not poultry and tree fruits be raised on exactly the same land? In the hot valleys of California, especially, shade is an absolute necessity to poultry in summer. And where can be secured a more ideal and cooler shade than under a tree where every breeze can circulate and where the ground is protected from the intense sunlight and is therefore cooler?

Not only do the fowls benefit from the shade of the trees and from the natural tonic action on the digestive organs of the ripe fruit itself in many orchards, but the trees benefit greatly from the fowls. The chickens eat a great many harmful insects and worms; they help to clean up the fallen fruit and destroy the larvae of parasites that develop in such places; they help to keep down weeds; and most important of all, they are continually adding new fertility to the soil to replace that which is being taken away in the form of fruit.

We are all of us coming to realize more and more strongly that the most economic type of farming in general is that type which utilizes livestock as a medium for marketing the vegetable products produced. The alfalfa and grain grower who feeds these products of his land to cattle and then markets the cattle or their by-products, such as milk, is able to return the fertility taken from the land by the crops back to the land in the form of manure. The fruit grower is unable to do this because the fruit is grown expressly for man's consumption and must therefore be shipped off the farm. If this fertility is not replaced and the productivity of the land maintained, in a few years' time it will be worn out and useless.

Poultry can occupy the same land that the trees do, thus double cropping the land, and both will do better and give better returns than if they were raised on separate pieces of land and two incomes are secured for each acre.

In very young orchards the trees may be protected where necessary with three-foot wire netting until they become large enough so that there is no further danger of their being defoliated. In this connection one will find that if green stuff, such as alfalfa, rape, kale, chard, barley, etc., is grown between the young tree rows so that the fowls can get plenty of green stuff without bothering the trees they will seldom eat the leaves of the trees.

The laying houses may be built at the sides of the orchard so that they face south and east, or they may be portable and scattered in rows between the trees like the tents of an army. With citrus fruits the houses should be built clear of the shadows cast by nearby trees so that the sunlight can freely reach all parts of each house in winter. With deciduous trees which lose their leaves the houses can well be built close so that the open fronts are shaded on the south side in summer.

From 120 to 160 square feet of range should be allowed per hen. If it is desired to divide the orchard into large yards so that a double-yard sys-

tem is used having two yards for each flock, then only one-half this amount, or 60 to 80 square feet, need be allowed per hen in each run. In this way the fowls in a flock can be shut out from one of the yards while the trees are being sprayed, the land plowed and sown, while irrigation is being done or fruit picked, or during any period when it is desired to have the chickens off the land for any reason. The double-yarding system is especially valuable in preventing the fowls from killing out the green crops such as alfalfa between the rows. After the fowls have cropped one run fairly close they can be turned into the other run while the growth in the first run is growing up again. With such a yarding system practically all the difficulties are eliminated and yet with the layers in flocks of 400 to 500, it is not necessary to cut the orchard up into less than one to one and a half acre runs.

A fowl produces between 30 and 40 pounds of night droppings per year in addition to the droppings deposited during the day time. The plant food in a ton of such fresh manure based on current fertilizer prices is worth from $7 to $12.

Observations and experiments indicate that poultry manure deteriorates very rapidly unless properly handled. This material is too valuable to the horticulturist for him to fail to care for it so that none of the plant food is wasted. Being rich in nitrogen, which is readily lost through decomposition unless steps are taken to render it stable, it must be cared for intelligently.

The free use of fine, dry loam, raw rock phosphate, kainit, acid phosphate, muriate of potash, land plaster or a combination of the above will effectively prevent the loss of nitrogen from poultry manure. Fine loam alone must be used in such quantities as to considerably increase the cost of handling.

The use of dry, fine sawdust as an absorbent, together with raw rock or acid phosphate to fix the ammonia and prevent its escape, preserves the manure in fine condition. Where it is not possible to apply directly to the land the night droppings should be collected three times per week and deposited in a manure bin or pit protected from the weather and dampness. When the manure is put into the bin after each collection it should be sprinkled over with the phosphate at the rate of 15 pounds to every 100 pounds of manure. The droppings boards may be sprinkled with sawdust or fine loam to make cleaning easier and dilute the manure.

Never use lime or wood ashes on poultry manure for these liberate all of the nitrogen by their chemical action.

Apply poultry manure at the rate of one to two tons per acre.

The litter used in the scratching sheds is very valuable for mulching to prevent evaporation and has some manurial and humus value.

One hundred fowls running at large on an acre should in one year have added to its fertility the equivalent of 400 pounds sulphate of ammonia, 200 pounds acid phosphate and 120 pounds of kainit.

POULTRY FOR PROFIT

Poultry for Profit, a practical manual for the beginner, the farmer and the side-line poultryman, by Jean A. Koethen, published by the Cultivator Publishing Co., Los Angeles, at $1.00.

For many years the California Cultivator has been busy in producing a practical farm paper which should give to all departments of agriculture in California as much cultural information as possible to pack within its 32 pages. It has been felt that every moment was so filled that it was hard to take time sufficient to enter into any publication effort. But it has had so many compliments for its poultry department that some months ago it was determined to bring out a poultry book. Mrs. Koethen, who has for some years been engaged in raising poultry and in telling of her methods in the columns of the Cultivator, was induced to take up the matter of gathering together a fund of information which should be of value to the beginner, the practical poultryman and the general farmer. Her copy was submitted to practical poultry people

International Harvester Tillage Implements

"GIVE me average seed and a good seed bed and I'll grow a far better crop than the man who has the best seed and prepares his ground carelessly."

These are words of an authority on crops and soils, and they express the growing attitude as to the value of good tillage implements. To grow full crops the soil at the bottom of the furrows must be mellow and compact, the top soil pulverized and free of clods and large air spaces.

An International Harvester disk harrow puts your soil in top-notch shape, conserves the moisture, adds enough to your crop at harvest time to buy several harrows. I H C disk harrows are strong enough for meadow slicing and for working the stiffest, hardest soils. Their steel disks keep an edge. The bearings are as nearly dust proof as disk bearings can be built.

The full line of International Harvester tillage implements includes every style of disk and smoothing harrow and the best line of drills, seeders and cultivators built. See the I H C local dealer for full information about the line, or send to us for catalogues.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Incubating Duck Eggs

Can you give instructions for successful incubator hatching of ducks in this climate?—Subscriber, San Diego.

The main differences between the incubation of duck eggs and that of hen's eggs seems to be that the duck eggs require a slightly lower temperature, a little more ventilation and in California, at least in dry weather, a little more moisture. Authorities differ so much in their instructions that it is difficult to lay down any rule. Much depends on the incubator and on the weather. James Rankin, the highest authority on duck culture in this country, advises that the temperature be kept at 102 degrees Fahrenheit the first two weeks, with the thermometer on the eggs in the center of the tray, and 103 degrees thereafter, cooling the eggs a little once a day for the first week and increasing the time later. A little moisture used after the eighteenth day. Ventilate the incubator a little more toward the end of the hatch. Robinson says "They require more ventilation than hen eggs because the egg is larger and therefore more difficult to dry down, and because it has to be dried down to an air space proportionately larger than in the hen egg. A larger air space is needed to give the larger head and bill of the duckling room to work. Operators advise cooling duck eggs longer than hen eggs. Some California breeders advise keeping the temperature at 102 to 102½ degrees up to the last few days of the hatch. A higher temperature than 103 degrees is said to be fatal. In dry weather begin about the beginning of the second week to sprinkle the eggs very lightly with warm water just before they are returned to the machine after turning. In damp weather little if any moisture is needed. You would do well, if your incubator instruction book gives no instructions for duck eggs, to write the manufacturers for specific instructions, but I think you will be safe being so near the coast, and with the wet season we are having this year, in running your machine at 102 or 102½ up to the last three or four days, and cool a little longer than you would hen's eggs, using no moisture. Hens are very successful as hatchers of duck eggs, and it looks as if any method of running the machine which is successful with hen's eggs could not be far wrong with duck eggs.—J. A. K.

Butter Slow to Come

Please tell me why we have to churn our cream six or seven hours before it will come, having the cream at 60 degrees. The cow is just three years old, has had two calves. The last one is five months old. Cream used to come very quickly. I could stir with a spoon and it would grain and come to butter in about ten minutes. After a while it took a half hour to bring it, now it takes six or seven hours. We feed her alfalfa and oat hay and plenty of water. Some times she will go and lie on the manure pile instead of on the ground when it is cold—Subscriber.

This is a usual trouble with home butter making during the early winter season. To understand it perfectly we must go back to fundamental principles of butter making and look a little into the behavior of butterfat under certain conditions. When the cow is fresh the butter fat globules are usually larger than after she has been milked several months. They are also somewhat softer. Both larger size and softness render churning easier than if the globules are either small or hard and much easier than when they are both small and hard. The process of churning consists merely in so agitating the cream that the globules of fat will pass by each other frequently. As they pass by they cling to each other providing they are soft enough to cling. When hundreds of them have stuck together we get a grain of butter. Thus it is easy to churn with a spoon when the cow is fresh and on green feed and the temperature is right.

In creamery practice the cream is in proper condition as to ripeness and temperature when the churning requires about one-half hour. The creamery has no trouble with churning because its cream comes from many cows in all stages of lactation and on all feed. But the one cow is on one kind of feed and in an advanced stage of lactation. The churning is difficult in this case probably because (1) the cow has been in milk long enough for her fat globules to become smaller and harder than when she was fresh, (2) her feed of alfalfa and oat hay tends to make the fat globules hard, and (3) the temperature is not high enough to offset 1 and 2. As the easiest remedy I would suggest warming the cream to 65 degrees about 24 hours before churning and keeping it at that temperature until and during churning. If this makes the cream too sour, warm to 60 degrees and keep it there until two hours before churning and then heat to 65 degrees and hold to churning. If neither of these plans help any warm a few degrees higher. A quick heating of the cream just before churning is not so efficient because the butter fat does not change temperature so readily as the milk serum in which it is suspended.

Those Low Spots Call for a Creeping Grip Tractor

You do not have to go around low, wet spots in your field when plowing with a Creeping Grip tractor.

You go right *through* them, and finish the furrow at the end of the field.

The weight under the creepers is from 5 to 7⅛ pounds per square inch depending upon the size of the machine. This tractor cannot pack the soil. Neither can it mill holes in the ground and lose power in slippage, and good money in fuel. The creepers sit with a firm grip on the soil and get maximum traction from the power delivered. They oscillate over rough spots—carry the power plant smoothly and save money in upkeep.

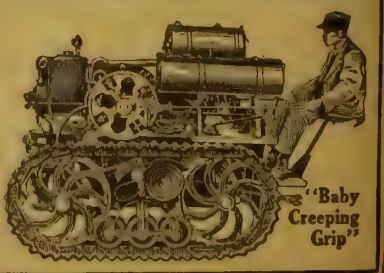
30 Brake—20 Tractive H. P.
15 Brake—10 Tractive H. P.

Bullock Tractor Co.
1814 Diversey Parkway Chicago, Ill.



Thus the thermometer might say 65 degrees while if one could get the actual temperature of the fat it might be only 62 degrees. So let the warming be a longer time before churning in the way suggested above. If 24 hours seems too long in practice for good results drop to 12 hours before churning to begin the warming. It is better not to put in any fresh cream less than 12 hours before churning for it will not be sufficiently ripened to mingle well with the older cream.

A change in feed may help the condition. Linseed oil cake meal tends to make a soft butter fat. It is, however, expensive, being quoted in Los Angeles at $2.20 per 100 pounds. It should not be fed in quantities of more than two pounds per day because of its loosening effect upon the cow. One pound per day might help the butter and would be enough to begin with. If any green feed is now available that would undoubtedly help much.—L. A.

Date Palms Unhealthy

Our date palms have a pale green, sickly hue. What should I do for them?—Subscriber, Orange.

The inquirer does not give enough particulars regarding these palms. This trouble may be the effect of scale, or because of excess or lack of moisture. If they are in pots they may be root bound. If they are in the open ground would suggest thorough spraying, if needed, working up the soil and carefully investigating as to moisture conditions.

Grafting

Can deciduous trees be successfully grafted just after being set out?—Subscriber, Escondido.

This would be an easy matter, especially with apples. Stone fruits are somewhat harder to handle, but if one understands grafting there is no reason why they should not be grafted at that time or even while out of the ground and ready for setting out.

Fungus on Rose Leaves

Am sending leaves infected with some disease or blight. What is it and what will cure it? For more than a year the buds have been blighted almost as soon as they began to show any color. The leaves of the bush have become mouldy and blistered in spots. Ultimately they blister and drop off.—Subscriber, Chino.

These leaves were seriously infected with the ordinary mildew and, in addition, a rust closely resembling the ordinary "orange rust" of the blackberry. The leaves were referred to Professor Fawcett and he replies that we were correct in assuming that the trouble was the ordinary mildew and rust. He recommends, "A spraying with Bordeaux might help to control both the rust and mildew. Sulphur is supposed to be as good as anything for the mildew." We would suggest that if the bushes are near a building or painted surface care should be used in spraying, for some kinds of paint are badly spotted wherever the spray touches them.

Killing Morning Glory

I have noted your reference to killing morning glory and as I have had some experience I give a hint as to my method of handling. It grew so thick on my place that no weed cutter I could secure would go through it without clogging. I have killed it out on ten acres of orchard by spreading two or three inches deep with almond hulls, applied in the fall. The following summer I cut what little comes through two or three times with the weed cutter.—W. H. Adams, Acampo.

We presume but few will be able to secure hulls as did Mr. Adams, but with such a serious pest the use of stable manure, straw or other similar material may be equally as successful. Other suggestions are apple pumace and olive pumace. The Cultivator some years ago referred to the fact that control had been secured in some cases by the use of cheaper grades of building paper or other heavy material, covering the edges or where the paper lapped with a few shovels of dirt, but this is expensive and of no value to the ground except to shut away the air and light from the pest. Any of these treatments or that of growing millet recommended by a sub-

Belgian Hares

Some of my Belgian hares are unable to move their hind legs. Eat and drink but get poor and die. Feed alfalfa meal and bran mash once a day. Give oat hay and crushed barley or cracked corn at other times and potato peelings, washed clean; sometimes malva weeds or vegetable tops. Have lost several fine does in past few months.—Subscriber, Moorpark.

This trouble is probably due to the feeding or may be dysentery. Would advise you to keep in clean dry quarters away from all dampness, and give twice daily a teaspoon of the following mixture. To one teaspoon of warm water add three drops of oil of peppermint and one drop of ether. Feed dry oats, dry bread or clover hay, a very little warm water and no green food whatever.—R. V. M.

Tankage for Hogs

What is tankage composed of? How is it fed to hogs in conjunction with rolled barley?—Subscriber, Delano.

Tankage is the refuse from packing houses and an average analysis shows it to contain about seven per cent of water, 15.9 per cent ash, 53.9 per cent crude protein, 5.6 per cent nitrogen free extract, 11.8 per cent fat. Henry, in Feeds and Feeding, states that pigs fed at the Nebraska station on tankage were larger and more economically fed than those fed on stock corn only. Not over nine or ten per cent of the ration should be of tankage, and five per cent is said to be sufficient where pigs are on alfalfa.

Liver Trouble

What is the matter with a hen whose comb turns a dark purple? It remains so for a few days and then gets better. It seems to be almost the entire head at times. Hen eats and seems well as any fowl.

A dark comb always suggests liver trouble of some sort, just what particular disease, it is impossible to say without a post mortem. Overfeeding and lack of exercise are the most common causes of all liver troubles, and the first step toward a cure consists in removing the cause. Make the mash light and bulky by adding more bran and alfalfa meal and reducing the corn meal and animal meals. Give all the green feed the bird will eat and make her scratch for her grain. If you can turn her out on green range for a time, so much the better. It would be a good plan to give the whole flock a few doses of epsom salts, about half a teaspoon for each bird, mixed in the moist mash, and give every other day till three doses have been given. Fresh dandelion leaves are excellent for liver trouble, and they will soon be ready to hand in many localities, if they are not already. If the leaves are not to be had you can get at almost any drug store a liquid extract of dandelion which will take their place. Mix a drop or two for each bird in the wet mash. A dose of this once a week all around for a few weeks may prevent further trouble in the flock, but remember, exercise and green feed are nature's two great remedies for a sluggish or congested liver.—J. A. K.

Oregon Grape

An Oregon subscriber has written asking regarding medicinal value of Oregon grape and as to whether there is a market for it. This question was referred to Mr. Carl Purdy and he answers: "The Oregon Grape (Berberis Aquifolium) has been used for medicine, but the demand for anything of that sort is never large and the large drug companies who are the only buyers always manage to secure it so cheaply that there is little or nothing in it for the average person. Years ago I looked up all of these matters but never found that there was anything in it for me. If your subscriber, however, is not satisfied with this he might possibly get in communication with the Parke-Davis Company, Detroit.

The Chinese Woolflower

The three most popular garden flowers the world over were all named and introduced by us within the past 20 years (the Golden Glow, Hybrid Cosmos and Gladiolus Childsi America) a record without a parallel. This year we add to the trio another novelty equally unique, equally valuable and of surpassing brilliancy. It will find its way over the world as quickly as the others did and take its place everywhere as the foremost garden annual.

The Chinese Woolflower is a Celosia of new form and easy growth, two feet high with a score of branches each crowned with a great crimson ball of wooly substance which holds its color and beauty all through the season making it the most interesting, novel and showy of all garden or pot annuals.

Price **20 cts. per pkt.** of 40 to 50 seeds; **3 pkts. for 50 cts.**, together with New BLUE PETUNIA and GIANT SUMMER COSMOS free for trial and Catalog.

Our Big Catalogue of Flower and Veg: Seeds, Bulbs, Plants and rare new Fruits *free* to all who apply. We are the largest growers in the world of Gladiolus, Cannas, Dahlias, Lilies, Iris, etc., and our stocks are best and cheapest.

A LUCKLESS VALENTINE

I long had loved a winsome maid,
But when my timid tongue essayed,
Without avail, to tell the tale,
I then resolved, though lips might fail,
That pen should speak—and so I wrote
My lady an impassioned note.

In every phrase to lovers sweet,
I laid my homage at her feet;
Extolled her face and form—in fine,
I humbly begged that she'd be mine.
Then wreathed it round with bloom
and vine,
And signed it thus: "Thy Valentine."

That eve we met—I'll ne'er forget—
Its pain pervades my being yet.
Her cheeks were flushed, her eyes
were bright
With young affection's tender light.
"Dear Jack," said she, "you ought to
see
The valentine that came to me.

"'Twas twined in roses all ablow,
And arrows sped from Cupid's bow;
And in the midst a rhythmic line
That breathed such burning love
divine
It made my heart with rapture thrill—
I knew at once that 'twas from Will."

"To you, dear Jack, I may confess,"
She said, unheeding my distress,
"That love is blind, or Will would see
I'm quite as much in love as he;
But he is such a bashful beau
I wish you'd kindly tell him so."

Moral—
When next I pen a lovelorn line,
I'll sign it "Jack," not "Valentine."
—Harriet Bunker Austin, in National Magazine.

FEBRUARY'S HOLIDAYS

Pray, Madam Fate,
Elucidate
Why you're so very chary
Of holidays
To other months,
And favor February?

There's Valentine
His day so fine,
And truthful George's fete day;
And honest Abe,
Whose natal time
Is for the land a great day.

"What! need I state,"
Said Madam Fate,
"Are you so very stupid?
Do you not see
It took those two
To counterbalance Cupid?

"Who full of wile
Did so beguile
Poor Valentine the sainted.
That lover's tricks
And perquisites
His honored rights have tainted.

"So honest Abe
(That wretched babe,
Dan Cupid roared with laughter);
I put before,
And truthful George,
Who couldn't lie, comes after."
—Woman's Home Companion.

THEIR VALENTINES

"Tomorrow'll be Valentine's day," began Lilly.

"And we're going to send lots of valentines," said Jenny.

"Lots of balentines," echoed wee Mabel, who had followed them to grandma's room.

"I wish I could see Miss Maberly's face when she gets hers," said Lilly, "and I guess May Evans won't feel like telling tales in a hurry."

Grandma looked puzzled. "I thought valentines were supposed to make people happier," she said.

"Not this kind," answered Jenny. "I guess," she added, "these are looking-glass valentines, 'cause they make you see yourself just as folks see you.

"You see," confidentially, "Mary Evans hears us say something about another girl, and then she runs to her and tells just what we have said, and it makes lots of trouble."

"It naturally would," replied grandma, soberly. "I know nothing could make more."

"You wouldn't like it yourself," said Jenny.

"I am sure I shouldn't," answered grandma. "I think," she added, meditatively, "I think, with such a girl round, I should say only nice things about the girls. Perhaps they wouldn't mind those."

"Of course we can't always do that," said Jenny, although her cheeks grew a trifle redder.

"Yes," interrupted Lilly, "and we're going to send Miss Maberly the picture of a cross old lady."

"Shall I tell you a story?" asked grandma.

"Oh, do, do!" they cried.

"I will tell you a story of Saint Valentine's day. There are a great many reasons given for the celebration of the day. It is said there was an old pagan custom of choosing brides on February 14th, but I like this story best. Long, long ago there was a bishop of Rome named Valentine, who went about doing good deeds, but because the people did not believe his preaching, they cast him into prison, where he finally died.

"When he was gone, the poor people whom he had all his life been trying to help were very sad. They had no one to help them now, no one to give them food and clothes, and to care for them when they were ill. And because they felt so badly about the bishop, they began to help each other, and if a man gave his poor neighbor a coat, he would say, 'I do this for Valentine's sake.' If he gave him food he would say, 'I feed you because when I was hungry Valentine gave bread to me.'

"They thought so much about him and told over so many of his good deeds that at last they began to think he was something more than a mortal man, and must be a saint; and since February 14th was his birthday, they called that Saint Valentine's day, and sent presents to their friends to keep the good bishop in remembrance."

The girls drew a long breath. "I didn't think Valentine's day meant that," said Jenny, soberly. "I don't believe May is coming," she added, "and I'm glad of it, for I shan't send those Valentines.

"Nor I," echoed Lilly.

"Suppose you spend the evening with me," said grandma, "and we'll see if we can't help along the good saint's work."

All the evening, while mother and grandma looked on approvingly, the girls worked industriously, cutting from cardboard little heartshaped boxes, which, after being folded, pasted and covered with crape paper, were left upon the table, that grandma—as she suggested—might add a few finishing touches.

If she and mother worked until far into the night, they were well repaid by the rapturous "ohs!" that greeted the pretty pink and lavender boxes, gay with clusters of pansies and forget-me-nots which had been painted upon them, while in gold upon each box were the words

A Valentine for You.
Sweets to the Sweet.

The "ohs!" were louder than ever when, upon lifting the covers, every box was found to be full of cream walnuts, dates and chocolates—a sweet valentine indeed!

The girls all declared there were tears in Miss Maberly's eyes when she found the surprise box upon her desk.

"It has been such a happy day!" said Lilly, as she and Jenny sat upon the sofa in grandma's room that evening. "The girls were all as nice as could be, and even Miss Maberly hasn't been the least little bit cross."

"Perhaps Miss Maberly's girls have done better than usual," said grandma, smiling.—Exchange.

Two level tablespoonfuls Ghirardelli's Ground Chocolate; one-third cup sago; one cupful water; one piece stick cinnamon one-half cup chopped citron; one-half cup chopped almonds; one-half cupful sugar. Soak sago over night and drain next morning; put in a double boiler with water and boil until thick; add cinnamon and citron and cook thirty minutes; remove cinnamon and add almonds, sugar and chocolate. Remove from fire as soon as sugar is dissolved and set away to cool. Serve with cream flavored.

Topsy Turvy Dainty

The Telephone Unites the Nation

AT this time, our country looms large on the world horizon as an example of the popular faith in the underlying principles of the republic.

We are truly one people in all that the forefathers, in their most exalted moments, meant by that phrase.

In making us a homogeneous people, the railroad, the telegraph and the telephone have been important factors. They have facilitated communication and intervisiting, bringing us closer together, giving us a better understanding and promoting more intimate relations.

The telephone has played its part as the situation has required. That it should have been planned for its present usefulness is as wonderful as that the vision of the forefathers should have beheld the nation as it is today.

At first, the telephone was the voice of the community. As the population increased and its interests grew more varied, the larger task of the telephone was to connect the communities and keep all the people in touch, regardless of local conditions or distance.

The need that the service should be universal was just as great as that there should be a common language. This need defined the duty of the Bell System.

Inspired by this need and repeatedly aided by new inventions and improvements, the Bell System has become the welder of the nation. It has made the continent a community.

VALENTINE DAY MENU

Written for the California Cultivator By Isabel Cottle

Breakfast

Grape Fruit with Maple Syrup
Cheese Omelet Creamed Potatoes
Dutch Apple Cake Coffee

Lunch or Supper

Creamed Veal with Noodles
Baking Powder Biscuit
Spiced Cranberries
Red and White Salad Olives
Heart Cookies Tea

Dinner

Clear Broth
Beef Loaf, Browned Riced Potatoes
Baked Brussels Sprouts
Apricot Pickles Rolls
Cherry Ice Moulded in Hearts
Valentine Cake Coffee

Dutch Apple Cake

Two cups flour, one-half teaspoon salt, two teaspoons baking powder, one-fourth cup butter, one egg, one cup milk (scant), two teaspoons sugar, four sour apples. Sift dry ingredients together and work in shortening, gradually adding egg and milk. Spread one-inch thick in pan, slice apples over top and sprinkle with sugar and cinnamon. Bake 30 minutes.

Noodles

One egg, one-half teaspoon salt, flour. Beat egg slightly, add salt and flour enough to make very stiff dough. Toss on floured board, knead and roll as thin as possible. Roll up and slice thinly. Allow to dry and toss apart. Cook in boiling water, salted, 20 minutes. Remove to colander. Pour cold water over them and drain well. Arrange alternate layers of chopped veal and noodles, seasoning each layer with salt and paprika and butter, having noodles on top. Moisten slightly with stock or milk. Do not use too much liquid at first but add more if necessary. Bake 20 to 30 minutes in moderate oven.

Red and White Salad

Cut from slices of cold boiled blood-red beets and from potatoes many small, red and white hearts; lay these on a bed of lettuce. Serve with mayonnaise.

Valentine Cake

A cup butter, two cups sugar, one cup milk, seven eggs, whites only, one cup cornstarch, two cups flour, one-half teaspoon soda, one teaspoon cream of tartar. Cream butter and sugar together, add the milk alternately with the dry ingredients sifted together. Flavor to taste. Fold in the whites of the eggs beaten to a stiff froth. Bake in moderate oven. Cut in squares, ice with white icing and decorate with red candy hearts.

GRANNY'S TRIBUTE

The Rev. Mr. Lawrence had boarded for so long a time with the Granby family that when he was obliged to remove to a new field of labor the family keenly felt his loss.

"The best pastor we've ever had in this town," declared Father Granby heartily. "I don't expect to see his equal again."

"Such good company," said Mother Granby; "and so sympathetic if the least thing went wrong."

"He was the easiest man to cook for I ever knew," contributed Aunt Ann. "He was always satisfied with what he had to eat, and he never grumbled."

"He had such a serene disposition," sighed Sister Laura. "He brought an atmosphere of peace whenever he came into the house."

"Granny" Granby, in her corner by the fireplace, shook her head dolefully as she added her tribute of affection.

"I'll miss him dreadfully," she mourned. "He was the best hand at ketching moth-millers ever I did see."
—Youth's Companion.

WORTH WHILE THINGS

You needn't be famous or clever or great
Or wealthy or always in style
If only you're honest and decent and kind
And true to your friends, at the finish you'll find
That you're done about all that's worth while.
—Detroit Free Press.

Planet Jr. Seeder-Harrow

Planet Jr tools are the greatest time-, labor-, and money-savers ever invented for the farm and garden. They pay for themselves in a single season in bigger better crops, and last a lifetime. Fully guaranteed.

USEFUL ARTS AND CRAFTS FOR BOYS AND GIRLS

Mothers and teachers who wish to keep the young people cheerfully busy in useful tasks about the home or farm may be interested in a project of the United States department of agriculture for organizing farm and home handicraft clubs. Some of the arts and crafts in which the department's specialist in charge of club work for the Northern and Western states hopes to interest his boys and girls are as follows:

Rope tying and splicing.
Making seed testers (box, blotter, and rag-doll testers).
Making a hen coop and brooder.
Fruit tree grafting and tree surgery.
Making a fly trap.
Making wood box for kitchen or sitting room.
Making a bird house and watering trough.
Making a hot bed or cold frame.
Making a step ladder or handy ladder for farm and home.
Making one dozen vegetable market crates.
Sharpening saw, pair of scissors.
Making a medicine cabinet.
Making and laying a cement walk or floor.
Making a bookcase or library file.
First aid to farm implements.
(a) Repair whipple trees.
(b) Pair of shares.
(c) Fork handle.
(d) Repair gate.
Drawing plan of 80-acre farmstead.
Forging—two kinds, practical, related to farm work.
Welding—two kinds, practical, related to farm work.
Horseshoe making.
First aid to household furniture:
(a) Chair.
(b) Table.
(c) Picture frame.
(d) Door lock or hinge.
Pressing and cleaning a suit of clothes.
Papering a room.
Painting, staining or treating floor.
Making a farm dooryard gate.
Making a home-made fireless cooker, one of two methods.
Making a home canner, one of two methods.
Making a kitchen shelf or kitchen work chair for mother.
Get out a set of plans and specifications for model farm home.
Show how to give first aid to school furniture and equipment; such as the repair of a seat, window, fence, broken gate, blackboard, steps and sidewalk.
Show how to repair the cover or broken back of a book.
Art metal work for household.
Modeling in clay and plaster.
Leather work; repair of leather goods or art work.
Fabric dyeing and printing.
Pottery for use in the home.
Basketry for use in gathering and marketing vegetables and fruit.
Making a milk stool.
Home-made fruit juice and cider mill.
Hall hat and coat rack.

These are mere suggestions which have been sent out to different state and district leaders in the Northern and Western states. It is hoped this list will enable them to encourage lines of work that have an economic value in the farm and home management of any community.

The new clubs it is expected will be merely the agricultural clubs already organized among the young people and the new lines of industrial work will be taken up at times and seasons when corn, pigs, chickens, and vegetables do not need the special attention of the boys and girls. Under the new plan each club member will probably select about ten of the suggested tasks and do each of them during convenient moments. The results of the work of all the members of one club will be exhibited at the end of a year's time in a place where the rest of the community may see what has been attempted and pass a judgment on its value.

Any mother or teacher who would care to interest her children in any of the arts and crafts outlined above may write for further details to Office in Charge of Club Work for the Northern and Western States, United States Department of Agriculture, Washington, D. C.

3498 Letters In Six Days

25c for Three Months — The Country Gentleman

They came from every state in the Union—not a state missing—in response to one single article in THE COUNTRY GENTLEMAN.

Within a month nearly 10,000 of our readers wrote the Department of Agriculture at Washington, asking for the bulletin referred to in our article.

The official in charge of this governmental department says: "What the people want nowadays, especially those who read the agricultural journals, *are facts told in the least possible space.* I thought you would be interested in this one illustration of how your feature articles are received by the public. Every state in the Union has been heard from."

Ten thousand letters in one month about one article gives some idea of the value of a wide-awake farm weekly to wide-awake farm people.

You need this up-to-date fact paper in your farm business!

Incidentally—Is there any farm problem that is bothering you? THE COUNTRY GENTLEMAN will solve it.

Any problem about management, crops, feeding, markets, orchards, chickens—any farm question at all—will be answered for any reader of THE COUNTRY GENTLEMAN personally and promptly *by mail.* We have more than 100 experts to perform this service for you absolutely without charge.

Ordinarily THE COUNTRY GENTLEMAN sells for five cents the copy or $1.50 the year. But—

To put this big national farm weekly at once into half a million farm homes, the next 13 issues of THE COUNTRY GENTLEMAN *will be mailed to your address for 25 cents—less than two cents a copy!*

Citrus Fruit Market

LOS ANGELES, Feb. 10, 1915.

There is no material change in the orange market, though it is possible a little firmer condition prevails and the fruit frozen in transit has been largely cleaned up. The outlook for improvement is good.

There is no change in lemons. Large numbers of foreigns are still coming.

Shipments.

Shipments of oranges to date from Southern California since November 1, 1914, 4625 cars; lemons, 881; total, 5506. To same date last season, oranges, 5487; lemons, 414; total, 5901. From Tulare County this season, oranges, 5057; lemons, 131; total, 5188. Last season oranges, 4275; lemons, 25; total, 4300. From Northern counties oranges, 564; lemons, 1; total, 565. Last season, oranges, 388.

Martinez Nursery

Established in 1884

T. S. DUANE, Prop., Martinez, Cal.

All leading varieties of fruit and ornamental trees.

GRAPES, ORANGES and LEMONS.

One planter near Hanford, Kings County, will set this season 350 acres of prunes.

just past considerable business has been done. The general tendency is upward and nearly all kinds of fruit are being held pretty firm. Better conditions seem to prevail in the South, caused by cotton beginning to move into foreign markets. This we hope will improve the peach situation.

In the peach market, while it is being held firm and values more steady, there has not been much of an advance in prices, but we hope that in the near future we will see an advance.

Apricots are steady at advanced prices and we believe that this market will stiffen and that no lower prices on this variety will be seen this season.

On account of there being no great quantity of pears left the price has slightly advanced, but at the same time the price is dependent a good deal on the quality.

Prunes are stronger and higher and business in this line generally good and there is promise of still further advances. While the prices are being held stiff on this article there are not many sales being made.

While there are some raisins being sold right along, the demand is not very strong on account of the time of year for the heavy demand being past.

Stocks of fruit in eastern jobbers' hands are not large so there should soon be a much better demand for all kinds.

The steamship companies have announced an advance in fruit rates of five cents per hundred, which makes the rate now 45 cents per hundred on dried fruit in boxes and 50 cents on dried fruit in sacks, and on dried fruit in a mixed car containing boxes and sacks, 50 cents per hundred.

There is a better feeling in business and financial circles than has prevailed for some time. This feeling is strengthened by the accumulation of idle capital looking for good investments. Although capital is somewhat timid still about taking hold, each day shows more confidence. Farmers will share in the general prosperity and the generous rainfall to date will permit a large acreage of land to be planted to grain.

Many of the European powers are placing immense orders for war material, food supplies, etc., with the large commercial concerns in the United States. This gives employment to many people and helps put money into circulation as cash is being generally paid for all this material.

Also, large quantities of wheat are being exported and more corn has been sent out of the country than ever before. For all these agricultural products the farmers of the Middle West have had cash.

The federal banks in some sections have reduced their interest rate to four per cent for short loans and five per cent for longer loans. This shows that the national banks of this country have a good supply of money on hand and do not have to borrow from the federal banks to any great extent. We will, on this coast, soon feel the effect of this, and provided something unforeseen does not happen, the year 1915 should be a prosperous one.

The Panama-Pacific Exposition will bring to California those who have never before been here and who will come in contact with the large resources of the West and see the possibilities of this state and who will invest money here, looking for better returns than they can get elsewhere.

The present season has not been a good one in many respects, conditions have confronted us which we have never had before, but we believe that before the beginning of another season things will have shaped themselves and conditions will prevail, the result of which will be an era of prosperity for this country.

POULTRY FOR PROFIT

(Continued from Page 181)

and they declared it to be an excellent and most fair statement of the opportunities in poultry products in California and most helpful in giving practical information as to poultry practice.

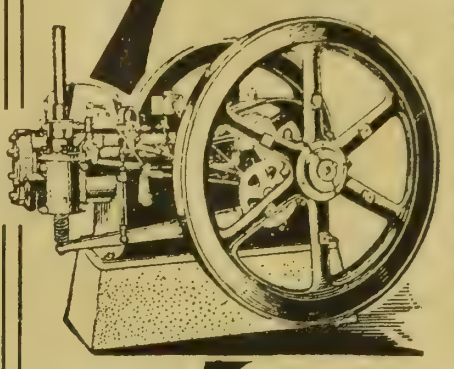
The book is now being mailed to those who have ordered it.

The wonder is that such a book can be produced for $1.00. There are 225 pages of reading matter, besides many plates and an index. The type is large and clear, the paper excellent, and it has one of the handsomest bindings of any book of its class we have seen. We trust our subscribers will pardon our enthusiasm, but it is all justified, for if there ever was a book published on the "money back" basis, this is it.

The circulation department of the Cultivator offers a suggestion on another page whereby this book may be secured for even less than one dollar. Meantime bear in mind the title of the book, which is the same as that of the poultry department in the Cultivator, Poultry for Profit, and if the instructions in the book are followed, it will prove true to name. Mrs. Koethen says in the opening sentences of the book; "This book is designed as a simple outline of the principles of poultry culture and a resume of the most up-to-date methods in use among practical poultrymen. There is no best method for any part of poultry work, but there are a few broad principles underlying all, which must be grasped by the learner who is seeking for best results."

STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅝c per gallon, cost one third of a cent per H.P. per hour to operate.



All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

Before you buy an engine send for our catalogue—free to all who write for a copy.

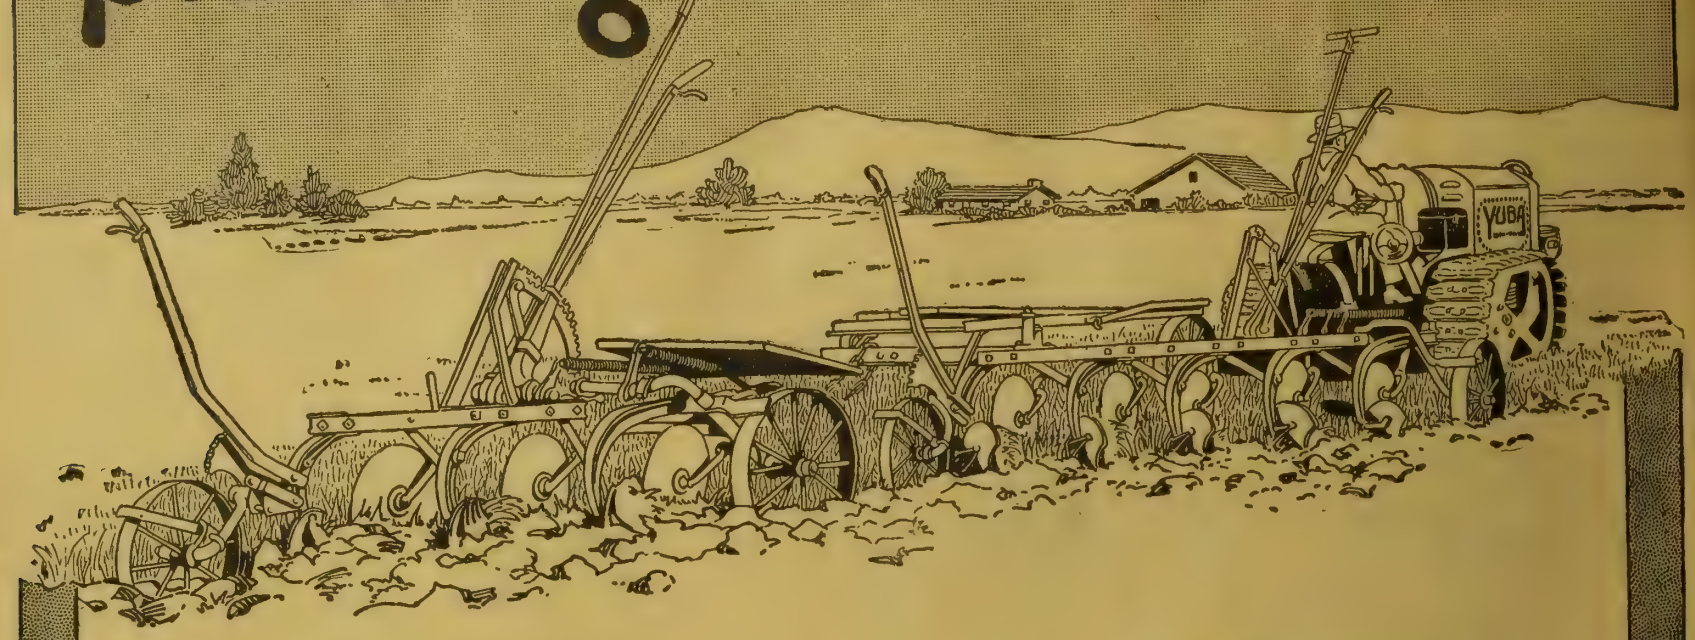
THE YUBA BALL TREAD TRACTOR

See Yuba Tractor Advertisement on Page 96

Giant Winter Rhubarb

NOW BEST TIME TO PLANT. Should return from $1,000 to $1,500 per acre first year. If interested in Rhubarb, Berries or Cactus, write J. B. Wagner, Specialist, Pasadena, Cal.

plowing with the Yuba



No matter how hard the soil may be—no matter whether it is a light, sandy loam or a heavy adobe—The Yuba Ball Tread Tractor takes the plows through, going deep, too.

Many times we are asked to guarantee that the tractor will pull a certain number of plows. This we always decline to do. Soil conditions and textures vary so greatly that it is impossible. We do guarantee the Model 12 or 18 to deliver, at the drawbar, the power of twelve or eighteen horses—real live animals with head down and shoulder straining against the collar.

THE YUBA BALL TREAD TRACTOR

The Yuba Ball Tread Tractor never has to stop to rest. In an emergency it can work twenty-four hours a day. If this is necessary it can be equipped with electric headlights front and rear.

In the end it will have been found to have accomplished the work of three or four times the number of horses it is rated to displace. It cuts the cost of plowing-power and labor.

Where a Yuba Ball Tread Tractor is used, there is a surprising addition to the year's profits.

There is a booklet describing its uses and construction fully.

Panama-Pacific International Exposition

Saturday is Opening Day for America's and the World's Greatest Exposition of its Products. Seven Hundred Acres, Almost in the Heart of San Francisco, Covered with Buildings and Exhibits. The Grounds Offer Scenes of Wonderful Beauty and in Themselves Will be an Education. Exhibits Cover Hundreds of Acres of Floor Space

WHILE on the grounds of the Panama-Pacific Exposition a few weeks ago I pointed to a fort-like structure in the bay only a short distance from the entrance to the small yacht harbor at the bay entrance of the grounds of the Panama-Pacific International Exposition and asked my guide, Mr. Donald Murray, as to its use. He replied that it was "Fort Moro" on which was located a battery of 48 mammoth searchlights to be used as one of the means of producing the wonderful light effect which this great exposition will show.

There will be many wonderful exhibits. There will be much of educational interest, there will be opportunities for great commercial development, and there surely will be a great demand on the world's supply of adjectives to give proper description of the electric lighting which will make the entire grounds a blaze of glory. From Fort Moro these lights will play upon the Tower of Jewels, upon the beautiful colored domes of the buildings, upon the government prison upon Alcatraz Island, upon Angel Island, Belvedere and other striking points of San Francisco Bay and even upon the striking and peculiar images and features along The Zone. In addition, the individual building, court and street lighting will be most striking.

But the mission of this article is not to refer so much to the wonderment which will be caused by this great exposition as to ask a question and give one or two limited answers at least as to what the exposition has for the agriculturist. All the world has sent of its products. We have been so absorbed with talk of war that we have wondered whether Europe would be able to teach us anything at this time, but when we study the grounds where little Holland has planted acres of its horticultural products we feel there is proof that in one little spot in Europe agriculture still holds sway. Even war-torn Belgium will teach us many lessons agriculturally. Japan is showing one tree said to be between 800 and 900 years old, on which its owner has placed a valuation of between $3000 and $4000. But we will not stop to mention these interesting things which even weeks ago were there to instruct and astonish, but will give a few words which have been written for the California Cultivator by Mr. Leonard Carpenter, connected with the division of exploitation of the Panama-Pacific Exposition.

Leonard Carpenter

The most complete exposition ever held is true as to every branch of man's activities in the Panama-Pacific International Exposition, but especially to the farmers and growers. The reason that to them particularly this exposition is of great importance is because with the recent introduction of cheap power on the farms all of the age old methods are being discarded and the newer ways introduced which will make for more production at a less cost.

BYZANTINE DOORWAY, PALACE OF EDUCATION

In the palace of agriculture are shown all of the tools and methods which are used in the production of crops the world over. Here also are to be seen the displays of the gathered crops from the North and the South, the Far East and the West.

The farm machinery manufacturers have sent their tools and their experts and have so assembled their exhibits that most of them are working displays. In cases where this has been impossible small model machines have been built and are seen working under actual conditions but on a small scale.

The United States government exhibit in this palace is under the different bureaus which make up the department of agriculture. An exhibit of special interest is in connection with the placing of farm buildings in order to bring about better farming methods. This exhibit not only takes up the problem of proper placing of different buildings in relation to fields, slopes of land and to each other, but shows these as related to better management.

PALACE OF HORTICULTURE

The use of machinery for all branches of farm work is fully shown. The small individual machines which can be used on small unit farms to take the place of one or two horses, to the big tractor which pulls 20 bottoms at a time, are shown under working conditions in the demonstration grounds. Conveyors, lifts, engines and special machines, both for indoor and outdoor work, are exhibited.

Special branches of the agricultural industry are fully shown. Factories for butter and cheese making; margarin factories, grain elevators and creameries are only a few of the many working exhibits.

The experiment stations in the different states have made exhibits in special subjects. In order to see the lines which are being followed in this case the following list will be interesting: Agricultural chemistry, Indiana; horticulture, Massachusetts; forestry, Minnesota; animal husbandry, Iowa and Illinois; dairy, Iowa, Minnesota and New York; veterinary medicine, Ohio; economic zoology and entomology, Minnesota and New York; rural engineering, Iowa; economics and sociology, Wisconsin and Massachusetts; dry farming, Utah; irrigated farming, Colorado; cane sugar, Louisiana; maple sugar, Vermont; poultry husbandry, Oregon; and cotton growing, Georgia and other Southern states.

The food products palace is given over entirely to the foods of commerce and their methods of preparation. Many of the exhibits will show all of the steps from the raw product to the finished food of commerce.

In the matter of milk for instance. The milk can be followed from the time that it is obtained from the cow by means of mechanical milkers, through the cooling room and the creamery to the butter and cheese factory; or to the manufacturer of dried or condensed milk, and all the steps by which it is manufactured to its permanent form, whether cheese or powdered milk will be shown. In the creamery is exhibited all of the up-to-date apparatus for the successful carrying on of this business and the records which it is necessary to keep, how best to guarantee to the producer his rightful share of the profits, and how to help him in bringing up the

CAN INSECTS BE ERADICATED BY FUNGUS DISEASE?

THE matter of using fungus disease as a means of pest control is treated very fully in the article below, written by Mr. Smith of our state insectary. There is at the present time a little contention and considerable interest as to the efficiency of this treatment. We quoted a few weeks ago from a statement made by the Los Angeles County horticultural commission, which discredits this method of control and gives notice to orchardists that this treatment will not prevent the serving of notice for cleaning up trees, either by means of spraying or fumigation.

Dr. S. M. Woodbridge, who is advocating the use of fungus as a means of control and who has treated a number of orchards, insists upon the worth of his method. Replying to the criticisms which have been made Dr. Woodbridge says:

"It is many years since I have observed a disease which was working on the black scale. This disease I have continuously tried to reproduce in sufficient quantities to inoculate large acreages infected with the black scale. I have been disseminating this disease at my own expense for years in orchards of my acquaintances. The commission blames me for charging $3.00 per acre for inoculating when it costs an average of $25 per acre to fumigate. I have never collected $3.00 per acre, not until I had succeeded in various localities did I feel justified in asking even a small charge to defray expenses and to maintain my laboratory. I contend and can prove that this disease has killed the black scale at all ages and seasons under favorable conditions, and not only are the trees in the orchard freed from the black scale pest, but the pepper trees, oleanders, nightshade and all other scale-infested plants near by are also likely to be cleaned. Under less favorable conditions there have been a few cases where the treatment has been unsatisfactory—slower to "take" for some reason. My culture in not in a class with Friedman's tuberculosis "cure," but I insist and can prove that my culture is a cure for the black scale pest as anti-toxin is a cure for diphtheria."

* * *

THE USE OF FUNGUS AGAINST THE BLACK SCALE

By Harry S. Smith

CONSIDERABLE activity is in evidence at the present time on the part of persons interested in a commercial way in the use of a fungus disease as a practical means of control of the black scale. Any attempt to lessen the cost of fighting this and other insect pests is highly commendable, but methods of this kind should not be commercialized until they have been proven to be of value by persons fully competent to carry on research and who are financially disinterested. Until their usefulness is thus demonstrated it is not only the privilege but the duty of the agricultural and horticultural officials of the state to warn the growers to go slowly in paying out money for such questionable remedies. It should be made plain that the writer is not challenging the honesty of anyone putting these remedies on the market, but it is a fact that the determination of the practical value of entomogenous fungi, as in the case of other natural enemies, is a problem of such complexity that only men of special training or great experience are capable of solving it. There is an excellent field for experimentation but the method is not yet ready for commercialization. It is not only a question of a dollar or five dollars per acre thrown away for the introduction of the fungus, but where the treatment is ineffectual we must add to this cost the serious injury by the scale, which cost could have been avoided by fumigation or spraying. One has only to think of the million dollars which reliance upon the chinch bug fungus cost the farmers of Kansas and Nebraska, to understand the importance of thorough investigation before a remedy of this kind is placed upon a commercial basis.

Professors Rolfs and Fawcett, in a bulletin on the use of fungous diseases in combating the white fly in Florida (Bulletin No. 119, Florida Experiment Station) state that they secured satisfactory results by the artificial introduction of the spores of fungi attacking the white fly. The use of entomogenous fungi in Florida is a very different matter, however, from the attempted use of this method in a country with a dry climate like that of our own state. It is axiomatic that fungous diseases require humidity, hence their practical use in California is confronted with an almost insurmountable handicap at the outset. This handicap should not stand in the way of experimentation, but it should make us doubly cautious in accepting the "fungus cure" for our insect ills in this state and in spending money for their introduction into our orchards.

Unfair advantage is sometimes taken of the growers' lack of reliable information on such subjects. The commercial concern which advertises to dissipate your insect pests via the fungus route works about as follows: A small amount per acre, usually from a dollar to three dollars, is charged in advance to cover the cost of introducing the fungus. If the insect against which the measures are directed does not become seriously abundant a further amount is collected from the grower. Should the insect increase in the usual way, no further charge is made. The concern handling the fungus has everything to gain and nothing to lose, for it is well known that the black scale frequently fails to reach its maximum of abundance through the action of the hot summer, but nevertheless, regardless of the cause of the failure of the scale, the grower pays the additional charge to the fungus men, for they are always careful not to leave a check for determining whether or not it was the fungus or something else which was effective.

In contemplating the practical use of the fungous diseases of insects it is important to consider whether or not the disease is indigenous, i. e. whether it is native to the locality, or is it absent but obtainable from some other place.

Where a fungous disease is absent and the reason for its absence is that it has never been introduced and not

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FIVE YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

Teague trees are started right, grown right, and shipped right.

that conditions are unfavorable, it is always worth while to at least attempt to introduce it into the locality under consideration. In cases where the disease is native, or, if not native, so thoroughly established that it has become a component in the local flora and is therefore on the same basis as a native, the first question that arises is, what is the efficiency of the disease in this locality from a practical standpoint? The second, can its efficiency be increased in any practical way open to man? This second question is the one of greatest interest to us in the present connection. It cannot be answered by "yes" or "no." Even in Florida, where conditions are ideal for the growth of fungi, our best authorities differ as to whether anything is gained by the artificial distribution of the spores in the orchard. The writer is not a mycologist, but it seems to him that if the value of such practice admits of doubt under ideal conditions, such as obtain in Florida, there is occasion for much doubt under such conditions as obtain in California.

A recent article on the value of fungous diseases of insects, by an expert in the federal bureau of entomology (the Economic Status of the Fungous Diseases of Insects, R. W. Glaser, Journal of Economic Entomology, page 473, December, 1914) is so applicable to the situation in Southern California that I take the liberty of quoting a portion of it here:

"There can be no doubt that at certain times of the year, under certain conditions, epidemics of fungous diseases naturally contribute much toward controlling noxious insects. This, however, is a balance established by nature of her own accord. Can we help her?

Let us suppose that a given locality is heavily infested by a noxious insect; also that a number of individuals in this locality have died from fungus parasitism and, lastly, that we have found an infested locality free from such a fungus. We will naturally ask ourselves the following questions:

Can we cultivate this fungus?

Can we introduce it into the infested locality where it is not known to occur?

Will the fungus establish itself and will it spread and become effective?

On the whole, a favorable answer can be given to the first two questions. Many of the parasitic fungi have been cultivated on artificial media or on living insects kept in confinement. Such fungi have been introduced among healthy insects when the occasion warranted such procedure. The third question, however, has offered difficulties which in most cases have been insurmountable. Fungi are very dependent upon external conditions and in many cases the apparent absence of a particular fungus in a locality is usually an index of conditions unfavorable for its development, and an artificial introduction will be useless. If a fungus does establish itself in a locality it may not spread far from the centers of artificial infection, showing that conditions are favorable in and near the centers of infection, but not beyond them.

"In 1892, Franz Tangl, at one time interested in this subject, and now a well known physiologist at the University of Budapest, performed some infection experiments on nun moth caterpillars by using spore emulsions of Botrytis bassiana. In the laboratory the experiments succeeded, since all of the infected caterpillars died of 'muscardine.' Infection experi-

PLANTERS

Our New Book is now READY

—the book that every horticulturist in California has been looking forward to for years.

It is the concentrated experience of over 30 years in California Horticulture and contains complete cultural directions. It tells when and how to plant and gives detailed information in regard to pruning, with illustrations showing "before" and "after." It is a complete text book of 48 pages. Price 25c postpaid.

Here's how you can get a copy of this valuable book FREE

Send us a list of whatever you intend to plant this season—unless you have already placed your order. Tell us what varieties you expect to plant and how many of each and give us an opportunity to figure with you on your requirements. We have set aside a limited quantity of these booklets for prospective Fancher Creek customers and will be glad to send you a copy free of charge if you will send us a list of what you expect to plant this season. The supply is limited. Write us now.

We Grow Everything that Grows

It makes no difference what you may have in mind to plant—whether it is citrus or deciduous fruit or ornamental trees, vines, plants, etc.—we can supply you in almost any quantity and with the most magnificent stock ever grown in the State of California. If you haven't already received a copy of our 1915 illustrated price catalogue, we will be glad to send you a copy free on request.

ments in nature, however, where infested trees were thoroughly sprayed with spore emulsions, gave negative results. The nun moth caterpillars flourished as before. V. Tubeuf, who has done a great deal of work on caterpillar diseases, tried a series of similar experiments, and likewise obtained negative results when he tried to infect caterpillars in nature with Cordyceps militaris.

"Recently Billings and Glenn (1911) in attempting the artificial use of Sporotrichum globuliferum, the etiological factor of the white fungus disease of chinch bugs in Kansas, have reached very similar conclusions. In a summary of their experiments, they say:

(1) "In fields where the natural presence of the fungus is plainly evident its effect on the bugs cannot be accelerated to any appreciable degree by the artificial introduction of spores.

(2) "In fields where the fungus is not in evidence spores introduced artificially have no measurable effect.

(3) "Apparent absence of the fungus among chinch bugs in a field is evidence of unfavorable conditions rather than lack of fungus spores.

(4) "Laboratory experiments can be made to prove that artificial infection accomplishes results upon bugs confined in cramped quarters and without food, but in the field, where fresh and usually drier air prevails and food is abundant, an entirely different situation is presented."

Messrs. Morrill and Back, who have thoroughly investigated the problem of control of the citrus white fly in Florida by means of its fungus diseases, conclude that "The infections secured by artificial means of introducing fungi, have this far proved of little or no avail in increasing their efficacy after they have once become generally established in a grove."

We have in the citrus experiment station at Riverside some of the best mycologists in the country. At least two of these scientists have had much actual experience in the use of entomogenous fungi. That these diseases have practical value in California is very doubtful. If the experiment station believes, however, that there is any possibility of even partial success, they will unquestionably make a thorough study of the problem at an early date. Until that time the growers who have infestations of black scale would better invest their money in fumigation rather than in a grave uncertainty.

It is very gratifying that the county horticultural commissioners in the South have issued warnings to the growers to go slowly in trying this inexpensive cure. It may be very expensive in the final analysis. Their action is to be commended.

Deciduous Fruits

THE BEST PLUM

Written for the California Cultivator
By M. Sharpe

IN answer to your request for an article on the best plum for the state, I will say that my experience has been confined principally to Vaca Valley. Here in Vaca Valley we are working into the early varieties of shipping plums. This section being from a week to a month earler than other fruit growing districts in California, practically gives us a monopoly on the early market so it would hardly be profitable for us to plant to a variety that would come into heavy competition with some other variety in another district. The best method therefore is for us to grow the early plum, and other later distrists should grow later varieties. Thus we would avoid to some extent coming into competition with one another. For example, some localities are just beginning to ship cherries as we are finishing. The plum varieties I would recommend for Vaca Valley, in order of ripening, are the Beauty, Formosa, Climax, California Blue, Santa Rosa, Tragedy, Burbank, Wickson, Diamond and Gaviota. There are many other varieties grown here and of excellent quality, but later. Also the above named are good sellers and carriers, and we can put them on the Eastern market ahead of other districts. Climax and California Blue ripen together. We can ship the Beauty from here with the last of the Royal Anne cherries and before the Clyman, which to my notion makes it one of the most valuable plums that Mr. Burbank has ever produced. It is a very thrifty grower, its only drawback being the red in the flesh like the Santa Rosa, but its size, earliness and flavor overcome that.

Some of the later varieties that are valuable are Grand Duke, Standard, President, Imperial, Sugar, Splendor Monarch, Archduke, Primate, etc.

The Giant, Kelsey and Gros Prune, Yellow Egg, Silver Prune, Chalco and Washington seem to be going out of favor here. It gets a little too hot here for Kelsey, which needs a cooler climate. Gros Prune is not a regular bearer with us.

The President is one of the best, ripening after Grand Duke, a 4x4 plum, oval, blue, sweet and large, an excellent variety.

The Primate ripens after President, large, round, blue and good quality. Might be valuable for shipping in straight cars of grapes.

There is another plum here grown as a novelty. It ripens for Thanksgiving and sometimes later. It is delicious and a decided novelty for a home garden. It is called the "Uncle Ben." It is a yellow plum. I do not know whether it has any commercial value.

The sugar prune is a number one drying plum, being easier to dry than Imperial. The Splendor always sells high in the Eastern market. It is a small, long prune shape.

There are some varieties here that have been originated by men in Vaca Valley that if propagated commercially would undoubtedly prove very valuable, also there are dozens of varieties grown here on a smaller scale that I have not mentioned.

I know of no plum pests other than the ordinary ones common to our deciduous fruits.

The government has introduced lately a wild peach from China called the Amygdalus Davidiana, which is sent to reliable parties on request. It is being tried here by a few growers. It has the appearance of proving to be a very valuable stock for plums, etc. It is very thrifty with an ideal bark for budding, also it seems to withstand hardship a little better. As to its susceptibility to black knot I cannot say as it has not been tried long enough here to know.

Here is something else that may prove of value to many growers. A Marianna plum tree will grow in the vacant places in an old orchard where trees have died, and where other young trees will die if planted. It makes excellent stock to work on and will grow from cuttings. I have found no objections to it in any way.

SPRAY PEACHES

County Horticultural Commissioner H. P. Stabler of Sutter County is sending to peach growers the following information regarding spring spraying of peaches:

"All peach, almond and apricot trees should be sprayed with lime-sulphur just before the blossom buds begin to open in the spring. After the blossoms have opened this spray should not be used, but it is safe to apply until the buds have actually blossomed. This is for the control of pernicious scale, twig borer or peach worm, curl leaf and peach blight in peach trees, also twig borer and peach blight in almond trees. However, in case of peach blight infections the spring spray is only effective when the lime-sulphur spray or Bordeaux mixture has been applied before December 15. In other words, two sprayings are necessary to control peach blight.

"Shot hole fungus in the apricot trees is so similar to peach blight that the fall and spring applications are recommended for the control of this disease. Growers now generally use the commercial lime-sulphur sprays.

"In order to accomplish the best results in controlling the twig borer, a coarse nozzle should be used and the spray actually driven into the rough places on the trees under a pressure of 150 to 180 pounds on the spray pump. Hold the nozzle close to the limbs and cover the tree thoroughly with the liquid. The fine growth and twigs must be well coated.

"Curl leaf and peach blight will not be controlled unless every part of the small growth is thoroughly covered with the spray. Always keep the liquid well agitated in the spray tank.

"If rain prevents the use of lime-sulphur before the buds open, the Bordeaux mixture may be used even while the tree is in bloom without injury."

THE WALNUT INDUSTRY OF CALIFORNIA

Written for the California Cultivator
By J. G. Berneike

The December Bulletin of the state commission of horticulture gives statistics showing the acreage of bearing and non-bearing fruit trees by counties. Orange County leads with 11,965 acres of bearing walnut trees and 1789 acres of non-bearing. It is followed very close by Los Angeles County with 10,074 acres of bearing and 2063 acres of non-bearing trees. Ventura County follows with 7785 acres of bearing and 2623 of non-bearing trees, and Santa Barbara County with 4800 acres of bearing and 800 acres of non-bearing.

These four counties are the only ones of importance in walnut production. All the other counties of the state are credited with 2514 acres of bearing trees and 5907 acres non-bearing.

Contra Costa County leads all other counties in the ratio of new plantings to bearing trees, namely, 20 acres bearing to 1200 acres non-bearing trees. San Joaquin County follows with 200 acres bearing and 1800 non-bearing. Then come Riverside and San Bernardino Counties. These latter four counties are plunging heavily into planting of walnut trees and the outcome will be watched with interest.

Comparing the figures as here given it is evident that our walnut growers need not feel greatly alarmed concerning a possible overproduction in the near future.

The large new plantings in Contra Costa and San Joaquin Counties must be considered as experiments on a large scale which may or may not turn out successfully. Riverside and San Bernardino Counties have only limited acres adapted to walnut growing. We may, of course, expect that in course of time acres adapted to walnut growing will be discovered here and there in the state, but it will take years of ttime and more or less of expensive experimenting before the acreage will be greatly enlarged.

The total acreage of bearing walnut trees for the state is 37,338, of non-bearing 13,182. It is evident that there will be quite an increase in the walnut crop when these trees come into bearing, but we will not be wrong in assuming that they will not all come into bearing. Many of these trees will fall for lack of proper soil, climate or care. And without a doubt, many of

CHEMICAL PLANT POISONS IN KILLING WEEDS

IN many letters received on the subject of weed eradication request is made for a "remedy," by which term the writers often have in mind a herbicide or chemical plant poison that will accomplish the destruction of weeds with little effort on their part. In many of these cases the use of plant poisons is out of the question as the weeds can be controlled more easily by some other method. It is well to define limitations as well as to point the advantages of employing these materials. The use of chemical plant poisons may be grouped under the following headings:

1. With crops on the land: General applications that kill certain weeds but do not injure the crop, such as iron sulphate solution for killing wild mustard in grain fields or dandelion in lawns; scattered applications for the purpose of killing individual weeds or groups of weeds, as salting live stock on patches of Canada thistles or applying arsenite of soda solution to plantains in a lawn.

2. Without crops on the land: Applications to kill the weedy growth, after which crops are to be grown; Applications to kill all vegetation and prevent as far as possible future growth of any vegetation, in other words, to sterilize the soil.

It is the second of these methods, using herbicides without crops on the land, that will be considered here. Killing the weeds by plant poisons and afterwards growing crops on the same land is a subject that seems to be of much popular interest. There are but few situations, however, where this method is feasible. In Australia fields containing prickly pear have been sprayed with an arsenite of soda solution, and after the pear has been killed the land plowed and planted to crops. This office has found it satisfactory to handle honeysuckle under certain conditions by spraying the tops with fuel oil or crude petroleum and after the leaves are dead and dry setting fire to them. This removes all the tops and obviates the great inconvenience encountered in cutting them off or plowing them under.

The office has given considerable attention to applications for killing the vegetation and sterilizing the soil. This method is applicable to driveways, pathways, tennis courts, railroad rights-of-way, and similar situations. For the past five years experiments have been made at Arlington Farm (United States experiment station) to find the best material, the best strength of application, the best time of application and other points. The list of materials used embraced practically all those that have been suggested as being suitable for this purpose, including the following: Arsenite of soda, arsenate of soda, common salt, fuel oil, kerosene, gasoline, crude petroleum, sulphuric acid, coal tar, creosote oil (containing crude carbolic acid), iron sulphate, caustic soda, calcium chloride, sal soda. The prices at which these materials could be obtained were assigned in order that they might be compared in cost as well as in effect. These tests have shown that of all these materials there are three which at the prices assigned are better than any of the others, namely, arsenite of soda, common salt, and fuel oil.

There are several points to be considered in selecting the best material among these three. The prices used as a basis were as follows: Commercial arsenite of soda 25 cents per pound; common salt $12 per ton; fuel oil 12 cents per gallon. These are approximately the maximum prices which the small purchaser would be asked to pay. Under certain conditions the consumer may find the price of one of these substances relatively lower than the others. For instance, refuse salt can sometimes be obtained at a very low price. The character of the vegetation also governs the choice; broad-leaved plants seem to be relatively more affected by arsenite of soda than by salt or oil, as compared with narrow-leaved vegetation such as grass. Salt is often objectionable when used on brick walks or other conspicuous places on account of the white residue which remains for some time.

As to the number of applications required, it has been found that several light applications are better than one heavy one. This is partly due to the fact that weed seeds in the soil, which are but little affected by these treatments, germinate and produce a new crop of weeds after the first crop is killed. After the first year, however, the number of applications may be reduced until weeds cease to come up.

The quantity of these herbicides to use depends on the character of the vegetation and the soil. On some of the arsenite of soda plats where the vegetation was largely broad-leaved plants the tops had been practically killed by a remarkably light application at a cost of $1.50 per acre. The effects, however, were merely temporary and new tops immediately sprang up. As an illustration of the quantity of material required, a weedy driveway having such plants as blue grass, crab grass, plantain, clover, and dandelion could be almost cleared by treating it with any one of the following substances, the amounts being given on a basis of one square rod: One-fourth pound of commercial arsenite of soda dissolved in six gallons of water; 22 pounds of common coarse salt dissolved in nine gallons of water; or one gallon of fuel oil. All these applications would cost approximately 12 cents per square rod, or $20 per acre for the materials.

In the experiments the results with common salt have been somewhat erratic, so that preference should be given the other two substances. If a small area is to be treated and the cost is therefore not a primary consideration, salt should be used in larger quantities than advised above, dissolving it at the rate of one pound in one and one-half quarts of water. All applications should be made when there is no prospect of rain for 24 hours.—H. R. Cox, United States department of agriculture.

KAFIR, MILO OR FETERITA

A recent inquirer has written to the University of Arizona agricultural experiment station for information concerning the comparative merits of kafir corn, milo maize and feterita under irrigation. Answering this inquiry, Prof. Stanley F. Morse, superintendent of agricultural extension service, replies as follows: "The principal advantage of feterita over the other two crops is that it will mature in less time (about 90 days) and hence may be fitted into the rotation where milo or kafir would not do because of insufficient time for maturity before frost. Milo matures in about 100 days and kafir in 120 days. Feterita requires the least water, milo more and kafir the most. In feeding value the grain of feterita is about equal to that of milo or kafir, but it is softer and easier for animals to masticate. Feterita yields the least grain per acre (30 to 50 bushels or 1700 to 2800 lbs.), milo more heavily (40 to 60 bushels or 2200 to 3300 lbs.) and kafir (50 to 75 bushels or 2800 to 4000 lbs.), the most of all. Feterita resembles kafir corn more than it does milo. For silage kafir will yield more tons per acre than either milo or feterita. Kafir yields the best forage, feterita next and milo the poorest; feterita is frequently planted very early in the season to give an early crop of green feed. You will see from the foregoing discussion that feterita has a different place in the cropping system from either milo or kafir."

FIGHTING THE ALFALFA WEEVIL

Several methods of fighting the alfalfa weevil have been worked out by the bureau of entomology of the United States department of agriculture, according to the report of the bureau's activities for the year ending June 30, 1914. Valuable results, it is said, have been obtained from pasturing by hogs during the weevil's egg-laying season, and practical methods have also been found of poisoning the larvae in the field. A single economical spraying in the early spring will also protect the first and second crops. After the first crop has been removed, however, the most efficient tool that can be used has been found to be an ordinary spike-toothed harrow with the teeth laid flat and several layers of open-wire fencing stretched beneath. Parasites have also been introduced from Europe, the original home of the weevil, and they are expected to produce good results. Thus far this weevil has not spread greatly.

A native weevil known as Compsos auricephalus has been found in Oklahoma. This pest does some damage to alfalfa and also to growing wheat. Its life history is now being carefully studied.

MEASURING WATER

The very best statement we have yet seen regarding various systems of measuring water is contained in Bulletin No. 247, Some Measuring Devices Used in the Delivery of Irrigation Water, which has just been issued by the agricultural experiment station of the California college of agriculture. The tables and data in the book are based on work done under cooperative agreement between the office of experiment stations and the state engineering department of California and between the office of experiment stations and the University of California agricultural experiment station. Seventy or more pages are filled with information regarding water measurment, tables of different systems of measuring and illustrations of many forms of gates. Every irrigator in California will find in it material of great value.

PAYING FOR THE OPPORTUNITY TO SOW WEED SEED

Many farmers are paying as much as a dollar per pound for the opportunity to plant several pounds of weed seed each year. Others do not pay as much for the opportunity to sow the seed, but the cost of eradicating these weeds costs them many hours of labor and no small amount of money. The manner in which they avail themselves of the opportunity varies, but to give a specific and true example—an actual occurrence:

Two samples of alfalfa seed are offered for sale, one for $20 per hundred and the other for $16 per hundred. Sample No. 1 tests as follows: Weed seeds, none; chaff and dirt, none; germination, 94 per cent perfect. Sample No. 2 tests: Weed seeds, seven per cent, much of which is sweet clover which is not very noticeable to the average farmer; chaff and dirt, two per cent; germination, 80 per cent perfect.

If you buy 100 pounds of No. 1 you get 94 pounds of seed that will grow at a cost of $20, or a cost of $21.28 for 100 pounds of perfect seed.

For No. 2 you pay $16 for 71 pounds of perfect seed, or $22.54 for 100 pounds of perfect seed.

In the above case you pay $1.26 for the privilege of planting seven pounds of weed seed on your farm. Even greater variations than the above can be given. Every man should know how good the seed is that he is planting.—S. B. Nuckols, Colorado Agricultural College.

We may also speak of "domestic" mosquitoes, for several species prefer to breed in our rain barrels, clogged up roof-drains, broken bottles, dishes, and old tin cans on the rubbish heap which have collected rain water.

Mosquitoes can breed only in water, notwithstanding the many popular statements to the contrary. The whole structure of the young mosquito fits it for a life only in water. So in combating mosquitoes, the obvious remedy is to remove the breeding places. No pool or collection of water is too small or too filthy to serve such a purpose. The only requisite is that it be stagnant and that it remain permanent long enough for the mosquito "wrigglers" to reach full growth. Care must be used therefore in searching for breeding places so as not to overlook some of the smaller ones.

Ecuador has long been known for its numberless classes of delicious fruits which are exported by the shipload to Peru and Chile. No official records are kept of the quantities exported, as no shipping documents are required; but it is enormous. Estimates made from local shipping records show that during the first five months of 1913 the following exportations of fruits were made to Peru and Chile: 2089 tons of plantains, 5437 tons of oranges, 54 tons of pineapples, 46 tons of mangoes and 90 tons of tamarinds.

GREAT CROPS OF
STRAWBERRIES
And How to Grow Them

IS the most beautifully illustrated and most complete strawberry book ever written. It teaches the **Kellogg Way** of doing things and tells the whole strawberry story from start to finish. It explains how the famous Kellogg Pedigree plants are grown on the great Kellogg plant farms in Idaho, Oregon and Michigan, and pictures and describes all the best varieties, including the ever-bearing kind.

OUR FAMILY STRAWBERRY GARDEN

Whether you have a small garden or a big farm, you should grow your own strawberries. Kellogg's Big Red Strawberry garden will produce all the delicious strawberries your entire family can eat, summer and winter. You can have shortcake, strawberries and cream, preserves, jam and canned berries the year round for less than one cent per gallon. Our Book gives full information.

STRAWBERRIES

Yield more dollars per acre and give quicker returns than any other crop. Get our 64-page book and learn THE KELLOGG WAY, and make **$500 to $1200** per acre. The Book is FREE.

THE GARDEN

Written for California Cultivator
By Ernest Braunton

CALIFORNIA has, according to Dr. Jepson, but 94 species of trees, and more than half of these, or 59 species, are found in the north coast ranges. They are not exclusive however, for nearly the same number, or 57, are found in Southern California. Fifty-two species inhabit the Sierra Nevada, 49 the south coast ranges, and but 14 are found in the Sacramento and San Joaquin Valleys. Of course a few species inhabit all the five zones named, and these are: Alder, ash, elderberry, live oak, maple, and willow. No cone-bearing tree is found in either of the great interior valleys. Of the cone-bearers we have, grossly, 42 species, but if we except two junipers which have berries (the nutmeg and the yew, which bear plum-like drupes), we have but 38 species which are strictly conifers. Dr. Jepson gives us but 11 species of arborescent oaks, but on some of the channel islands the dwarf oak, known as quercus dumosa, and common over all of Southern California, grows to be 30 feet high, and in the same ranges is at least one other species, so we will claim a baker's dozen, at least, of oaks. We have a half-dozen willows, four ashes, three each of poplar, cherry and mesquite, two yuccas, two alders, one maple, one boxelder (a true maple also). Of the rest we have but one each; birch, buckeye, cactus, crab-apple, desert ironwood, desert willow (belongs to bignonia family), desert mahogany, dogwood, elderberry, ironwood, laurel, madrone, palm, smoke tree, sycamore, and walnut. This makes about 100 trees in the state. While other species may occasionally, owing to favorable conditions, attain the height and dignity of a tree, such character is not sufficiently constant to warrant inclusion in a list of California trees. Many shrubs under cultivation, with special pruning also become tree-like, but our song is of nature.

Inoculating Plants

From time to time we hear of some scheme for inoculating trees for the purpose of stimulation or prevention of diseases, or to drive away insects. Holes are bored into the wood and filled with some substance which it is claimed will be taken up in the circulation of the sap, in quite a similar manner to the method of inoculation in all animal life.

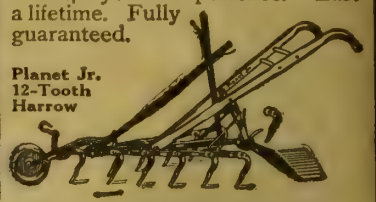
But it must be understood that sap circulation in plants starts at the roots and nowhere else may anything be introduced into that circulation. Prof. Farmer, in his "Plant Life" (page 60) says: "The circulation of materials in a plant is not really like the circulation of the blood in animals, although an analogy—largely a false one—is often drawn between them, for there is no continuous circulating system in the tree at all comparable with the arteries and veins of the animal body. Nevertheless there is a process of exchange, though arranged on different lines and serving quite different ends."

Do not be deceived by fakers who claim wonders (or anything) for material introduced through the bark of the tree.

Planet Jr. Harrow-Wheel Hoe

Planet Jr. tools save time, lighten labor, and get bigger, better crops at less cost. Designed by a practical farmer and manufacturer with over 40 years' experience. Last a lifetime. Fully guaranteed.

Planet Jr. 12-Tooth Harrow



Stronger, steadier in action, and cultivates more thoroughly than any other harrow made. Non-clogging steel wheel. Invaluable to the market-gardener, trucker, tobacco or small-fruit grower.

No. 16 Planet Jr. Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. Light but strong, and can be used by man, woman, or boy. Will do all the cultivation in your garden in the easiest, quickest and best way. Indestructible steel frame.

New Macatawa Everbearing Blackberry

Wonderful Vitality

Four out of the six "Macatawa" have started growth, which is satisfactory considering the roots were only packed in paper and sent this long distance.
Yours, faithfully,
TERCY FOWLER.
Shanghai, China, July 6, 1913

Address all orders to

Santa Cruz Bulb & Plant Company

8 New Street

SANTA CRUZ, CAL.

THE MACATAWA originated by Alfred Mitting, in 1909, at Holland, Michigan, a cross between the true Giant Himalaya and the Eldorado, and offered to the trade in the fall of 1912. I have named it the Macatawa as that term carries to me the idea of our cold Michigan winters and our occasional dry summers, which this berry stands without the slightest damage. It went through the extreme cold winter of 1911-12 in an exposed condition without freezing. The Macatawa has characteristics of both its parents. The fruit is very large and sweet, in fact it is the sweetest blackberry grown. It is coreless and almost seedless; very solid, jet black when ripe, and can be shipped 1000 miles without bruising. The shape is oblong, very uniform, averaging three and one-half inches around one way, by three and one-fourth inches the other way.

It begins blooming in the southern and coast states about February 15. In the eastern states about April 1st. One month later you can begin to pick. It is a continual cropper from Spring until the frosts, in fact it is the only berry in my 46 years' experience that is an everbearing variety.

Its habit is similar to that of the Eldorado, but self branching, and the bloom is almost semi double, about the size of a silver dollar. So far, all who have tried the berry, say that it is the sweetest and best flavored berry they ever tried. When it was in fruit at Berrydale, it was admired by everyone that saw it, and three thousand plants were sold to said visitors, in the fall of 1912. The young plants come from suckers and not from tips, but it is a shy sucker maker, so we propagate by digging up the roots between the rows and cutting same into one, and one and one-half inch pieces. These piece roots are sown in rows four inches deep, and the rows two feet apart. They should be sown in the southern and coast states from December 1st to March 1st, in the center states from March 1st to May 1st. By the next fall you will have nice plants full of fiber roots, and the plants will be 18 inches high and ready to plant in the field for fruit. Our price for these piece roots is $10 per thousand, one year old plants, $1.50 per dozen, $10 per hundred, $100 per 1000. 50 plants go at 100 rates, 500 at thousand rates.

The Macatawa Berry is 3½ inches one way by 3¾ inches the other

Macatawa Is a Great Berry for Canning

THE AVOCADO IN CALIFORNIA

Written for the California Cultivator
By Wm. A. Spinks

THE avocado is no longer considered a strictly tropical fruit, but is now known to have wide climatic range. Indigenous to Mexico and Central America, it thrives in its native habitat all the way from the tropical seacoast regions to the elevated plateaus thousands of feet above the sea, where it is subjected to quite as much cold as that experienced in the fruit belts of California. While these hardy, upland varieties will thrive here, and promise great profit to growers, too much care cannot be exercised in avoiding the more tropical types.

Let me name in their order of importance the points we must look for in an avocado tree for California planting. Just as the foundation is the most important part of a building, so with the avocado tree; the growth, strength and vigor of the tree itself outweigh all other considerations. It must stand straight and strong, defying alike wind, cold and heat. Without all of these qualities to start with no variety has any commercial value whatever. With them it has great value though it never produces a single fruit. Why? Because the foundation is being built on which to grow the variety of the future or to produce its own fruit as the case may be. Strong, well-formed trees may easily be worked over to any desired variety; while those same varieties, when budded into small nursery trees, may refuse to grow. Some varieties, the parent seedling trees of which grow healthy and strong and produce the choicest of fruit, will when budded into nursery trees grow nicely for a year or two, just long enough to enable the nurserymen to sell them, and when set out in the orchard promptly die. Others linger along for years, making little or no growth, while still others grow limp and limber and can never be petted and pampered enough to induce them to stand up and make trees. You must have a tree before you can have fruit.

Besides the points above mentioned as prime requisites in a tree, namely, growth, strength, vigor and resistance to heat, cold and wind, the next in order of importance is the fruit, its quality, size, color, shape, shipping qualities, season of ripening, prolificacy and regularity of crop.

There are two types of the avocado, so entirely different in character that they might almost be said to belong to different families,—the large, thick-skin kind, in parts of Mexico called Pagua (Pa-wa), weighing from eight ounces to two pounds, have been mostly sought for as commercial varieties, because of size and an impression that they make the best shippers. Considering the very few trees we have so far to select from and the hundreds, or perhaps thousands, yet to hear from, it is only reasonable to suppose that the perfect commercial variety is still of the future. Clearly then, the sensible and businesslike thing to do at this early stage of the industry is to plant a variety that will surely stand cold, wind and heat and make a straight, strong orchard tree. Then in five years, or ten years, or at any time in the future, if a variety of undoubted superiority appears, an orchard of it may be had in two years by top-working. Meantime, take the fruit and sell it. Your trees will probably pay for themselves many times before they need be worked over, if ever.

Four years ago I planted an orchard of a certain well-known variety. The trees are now five years old from the bud. They are as large as full-grown orange trees and beautiful to look at. I expect a considerable crop of fruit this year. I planted at the same time on adjoining ground an orchard of another variety. I was sorry at the time that I did not have more of this last named kind and less of the others. The parent tree seemed strong and healthy, but the young budded trees when placed in the orchard made poor growth, suffered from cold and were in due time taken out and replaced with another kind. These, also a failure, were in turn removed, and still another variety substituted. Now I am taking out this third lot and planting the variety in my five-year-old orchard. This time I am going to have trees, though they do not bear fruits weighing two pounds each.

No avocado should be left to ripen on the tree. Even for home use they should be picked while still firm and allowed to soften in the house. They should also be watched carefully and picked at the right time, like oranges, apples or any other fruit. Many varieties, in fact, nearly all of the thin-skins, and some hard-shells also, will, if left on the tree too long, ripen or soften at the lower end first, giving the fruit the appearance of decay and making it difficult to market. This can be avoided by proper picking, or, when the lower end of the fruit shows the least sign of softening or shriveling. There are other signs also with which the orchardist would soon become familiar and which tell him unfailingly when the fruit is mature and should be picked. For instance, one certain well known variety should be picked when it begins turning from green to purple; it is then in proper condition for market and will color and soften beautifully if kept in the house or may be preserved for weeks in cold storage.

All avocados when mature are rich in oil, recent analysis of certain varieties made by the University of California experiment station showing over 29 per cent. My own opinion as to the cause of the fruit softening at the lower end first, when left too long on the tree, is that this oil, liberated by the ripening process, gravitates to the lower or large end of the fruit where, aided by the sun's heat, it causes at first a slight shriveling of the skin, which gradually widens in area until it takes in the entire fruit. I have been told that in Mexico connoisseurs look for and demand fruits slightly shriveled at the end, considering it a sign, not only that the fruit is duly matured, but also of rich quality.

The avocado looms large as a future California industry and will eventually be cultivated over wide areas.

CHOICE BULBS

We are glad to make announcement of a clubbing proposition which the Cultivator has secured for its subscribers who may wish to beautify home grounds or roadsides in preparation for the many eastern visitors who we are hoping will come to California's great expositions this year. Let us rake up our front yards, our back yards, our roadsides, and, in fact, every place which may be made sightly instead of unsightly as are many at the present time. One of the handsomest flowers grown, and one which does remarkably well in California, is the old-time gladiolus or, rather, the new-time gladiolus for there have been so many improved varieties created by plant breeders and introduced from Europe that those who admired the gladiolus ten years ago and who have not kept in touch with it recently have a surprise coming in some of the beautiful hybrids which are now offered in all seed catalogs.

The interest in gladiolus growing has been so great that a magazine which has been published for more than a year has now secured a place amongst the magazines of the country and has materially advanced gladiolus growing. It it The Modern Gladiolus Grower published at Calcium, New York, by Madison Cooper. This is the magazine referred to above and it, with a bunch of choice gladiolus bulbs, may be had for a nominal sum by Cultivator subscribers. The practical suggestions in gladiolus growing will be of great value in our beautifying campaign and we hope many Cultivator subscribers will take advantage of the clubbing rate which is offered. The California Cultivator and The Modern Gladiolus Grower, which is a 50-cent magazine and a big value at that, will be mailed one year for $1.40 and, in addition, the publisher of The Modern Gladiolus Grower offers to send about 20 gladiolus bulbs of sufficient size to bloom. We say "about" 20 for there are at times more than that number, for if at all under-sized the weight is still maintained at a full pound. The editor of the Cultivator has seen this collection and the flowers which came from it and knows there are some single bulbs worth the 40 cents asked in addition to the Cultivator subscription. The offer is good to old subscribers and new as well.

A NATIONAL COMMISSION TO AID IN MARKETING

Written for California Cultivator
By F. D. Flint

THE volume of products from the farms of this nation is not increasing as rapidly as our population; in the matter of food supply we are lagging behind at a greater rate than we may realize.

With a vastly greater acreage of wheat, we have only increased our average total yield about four per cent in the past ten years. In meat production it is shown that in the year from March, 1911, to March, 1912, there was a decrease of meat animals totaling 646,600, or over 200,000,000 pounds. In the past decade we have added to our population 3,000,000 able bodied men capable of earning enough to allow them to buy and pay for meat as a food. Other facts could be added to prove the point.

What does this mean? It can mean but one thing, and that is we must have more producers on the farms or else very shortly we will become a food buying nation. It also can be inferred, quite correctly, that it will be a long time before there is any real overproduction of any food product. There is now a very marked underconsumption. In fact the cry "overproduction" is more theoretical than real.

There are periods during each season when we hear of gluts in the city markets. But these supposed "gluts" are the mere symptoms of bad management rather than of overproduction. When these "gluts" are reported, or said to exist, how many people in that city really "know" that there is a glut? Practically none. Why? Because of lack of information. That is the only reason. Otherwise there would be a rush to get products at a reduced price by the people who need cheaper prices. Our present methods of marketing do not provide any means for the consumer getting the information; in fact the produce dealers conceal the truth in order to keep up the prices. The retailers who buy from the produce dealers do not publish the facts for fear they may lose money if it becomes too well known.

In addition to all this the producer himself has no information on the markets and no way of getting it. He in turn is kept in ignorance for the most part by the jobbers and wholesalers of produce. In other words the jobbers (buyers) form a wall or ring about the producer and dictate prices because of their ability to keep him in ignorance of the market, what it is and where it is.

To sum it all up, the consumer in the city has no information on the real market conditions, nor has the producer in the country. It is an easy conclusion to reach, that a way must be provided by which both consumer and producer can have information. It is just as easy to conclude that this information cannot and must not be allowed to come from or through the wholesaler, jobber or buyer. It must come from or through some independent entity. When this entity for giving and distributing information is established the way will be open for the producer to have some say in the matter of what proportion of the consumer's prices he shall share. And the consumer will have a closer approach through that medium to the producer.

Any one at all familiar with the marketing of farm produce of any kind will realize at once that this medium or entity, permitting the close approach of the consumer and producer, is the missing link which has been long looked for.

But there is a way. There has been found a plan to provide this missing link. And with the adoption of this plan will be solved the question of the high cost of living for the city dwellers; the question of inadequate returns for the producer; the question of how to prevent the loss of a large proportion of the season's crop on the farms, because of inability to find markets; the question of railroad rates, by increasing traffic, rather than rates; the question of increasing tenancy rather than the increase of ownership, caused by the inability to make the farm pay for the ownership; the question of rural credits, because of having made stable the markets, and finally the question of whether or not we are to continue to be a self-feeding nation or become a food buying nation.

The plan thus mentioned is found in Mr. David Lubin's suggestion for a national marketing commission as provided for in a resolution now before our federal congress, known as House Joint Resolution 344, and which reads as follows:

"Resolved by the senate and house of representatives of the United States of America in congress assembled, that the president be authorized and requested to appoint a national marketing commission to be composed of 29 members, 15 of whom shall be farmers and 14 of whom shall be selected with reference to their eminence in commerce, law, finance, and transportation.

"That such national marketing commission shall meet in the city of Washington at a time designated by the president and organize by the election of officers, and adopt a plan of action for the effective organization of the states, counties and localities of the United States for the economic distribution of the products of the farm, with power to act in so far only as affecting individuals and organizations that shall elect to become a part of this national marketing system.

"First. Let the president of the United States appoint a national marketing commission consisting of (a) the president of an influential chamber of commerce; (b) the mayors of three of the largest cities in the Union; (c) three members of the leading mail order and department stores; (d) a leading railroad man; (e) a parcel post man; (f) a leading banker; (g) a leading workingman; (h) two congressmen; (i) a senator; making 14 in all; and in addition to these let the president add 15 farmers from the various sections of the United States.

"This committee of 29 would be the national marketing commission, who would meet and organize for the purpose of having the food products in

the various states of the Union distributed under the plan that shall be explained further on.

"Second. Said national commission shall have prescribed power of direction of similar committees to be appointed by each of the governors in every state in the Union.

"Third. Said state commissions shall have power to appoint committees of the same kind for every county in that state, and the county commissions shall have the right to appoint the township committees.

"The national commission, after organization, shall devise a plan for the delivery and sale of the products, by the farmers or their hired agents. They shall devise plans and specifications and details of sample rooms, auction rooms, exchanges, pits and street markets, and designate for the benefit of the producers or their agents, how the products in townships, counties, and states shall be synchronized for shipment, for display, by private sale or by auction, the rules for selling and delivery, the terms of sale and the mode of procedure."

Thus it is seen a way is opened up for the establishment of city terminals, whither the farmer may send his produce to be sold either at retail, wholesale, or by auction as he desires or the character of his shipment demands. At the same time these terminals can and will be required to furnish information to the consumers. There will be no guesswork about it nor hiding of facts. In reality the whole thing becomes a "clearing house of information" and a medium of instructive education for the consumer and producer alike.

In this connection it is well to bear in mind that these commissions are not permanently sitting commissions. They will provide the manner and method of doing the numerous things required, and have a secretary or executive officer in charge of a body of clerks hired for the work in hand. Neither are they selling commissions. The actual selling is done either by the farmer himself or by his hired agent, be it as individual or as association. The commissions only supervise and provide ways and means through which the farmer does the work. The salesmen at the terminals are bonded and operate as agents for transacting the business between seller and buyer, who may be producer and consumer.

The establishment of these terminals will come under the clause of the resolution reading "and adopt a plan of action, etc.," as will also the many questions involved in every act of packing, shipping, and mode of selling in the terminals. The educative instruction to the farmers will also come under this enabling clause, but there will thereby be no compulsion either for producer or consumer or organizations of producers or consumers to use this bureau. It will be there to use, and the selfish interest of the producers and consumers will show them the benefits to be derived from the use thereof. The very gambling instinct which drives the farmer to ship to some market with the hope that he will "hit it high" will also drive him to utilize this means of knowing where his market is, how he must pack and when he can ship to get the going price.

He will have ultimate information. There can be no conflict of shipment and consequent glut of market when there is some means whereby markets and supply are known to all concerned. It is this lack of information which is the difficulty now. Here is the way out. The question is do we want it? Are we willing to work for it and use it when it comes? Every man, be he producer or consumer, must answer that question for himself. If it is demanded with a sufficiently loud voice, congress will awake to the fact that there is something to be done for the products of agriculture as well as for the products of industry.

* * *

Mr. Flint has charge of the campaign in California and will soon make a tour of various farming sections.

VALUABLE NUMBER

There is one particular in which Australians excel in calling attention to the resources of that great continent. This is in the annual number of many of their publications. Some of them are works of art. One before us is that of the The Leader, published at Melbourne. The last annual of this paper contains 58 pages and the cover and has not only magnificent half tones 10x14 in size but many colored plates as well. "In the Heart of the Bush" shows a magnificent collection of tree ferns, while "On the Edwards River, New South Wales" is a picture in colors showing a wealth of shade and rich pastures. There are dozens of others equally as attractive. The text is generally given over to a description of the resources of Victoria.

John Deere Implements

John Deere Syracuse Hillside or Swivel Plows
Nos. 821, 822, 823, 824 and 825

The Syracuse Chilled Plow Company has devoted over forty years of careful study to the proper shape of chilled plows in order to get proper suction and perfect running qualities.

The popularity of Syracuse Chilled Plows can be attributed to the Syracuse policy of correct design, the very best of materials and the most careful workmanship.

The Chilled Plows with Perfect Fitting Parts

The parts of these plows are made right—they fit perfectly.

Syracuse Hillside or Swivel Plows do equally good work on hillsides or level land.

The value of the swivel plow is evident because of the fact that in throwing the furrows one way, the land is left perfectly level, without the objectionable dead furrows or waste land.

Moldboards are long and of good turn, insuring a clean furrow slice with grass and weeds well buried.

Some Superior Features

1. Option of white iron or hardened soft center steel moldboards.
2. Maximum strength with light weight secured by the use of malleable iron and steel.
3. Ample throat room and absence of open joints allow best of clearance.
4. Two-piece truss beam, providing lightest and strongest construction possible.
5. Body securely locked and easily released by means of patented foot latch, having adjustable tension.
6. Renewable shoe protects standard and fulfills the purpose of a landside.
7. Moldboards are of a new design, turning furrows smoothly up or down on hillside land.
8. Shares ground thin, such edge being essential to good work in plows of the swivel type, as the upturned edge serves as the shin of the plow.

Syracuse No. 822 Hillside or Swivel Plow

Nos. 821, 822 and 823 have automatic jointer or coulter shifters which do their work perfectly, bring the cutting edge into the exact position necessary for good work. Nos. 824 and 825 furnished with wheel only.

Write us for literature on Syracuse Hillside or Swivel Plows. We will send it to you Free.

John Deere Wheel Plows
With Quick Detachable Shares

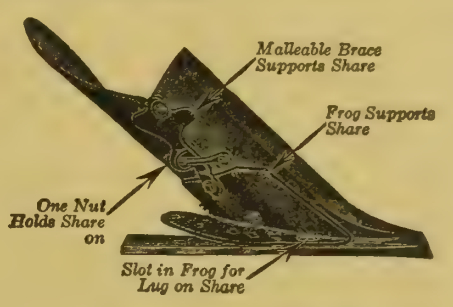
John Deere Wheel Plows, known the country over as "Quality Plows" are now fitted with John Deere Quick Detachable Shares—an exclusive John Deere feature.

These shares are popular with farmers—they make hard work easy.

Superior Features
Unscrew One Nut—That's All

Unscrew one nut and the share comes off—slip share on, tighten the one nut and you are ready for work.

The share can be removed in thirty seconds and replaced in sixty seconds. Takes from eight minutes to half hour to change old style bolted shares.



Here's what John Deere Quick Detachable Shares mean to you:

1. No trouble to change shares.
2. Eighty per cent of time saved.
3. No danger of damaging share.
4. Share is drawn up closer.
5. Share is stronger—not weakened by bolt holes.
6. Resharpened or sprung shares can be drawn into place—no drift punch necessary.
7. No unequal strain on share.
8. No danger of injury to hands in taking share off.

We have beautifully illustrated booklets on the following plows with John Deere Quick Detachable Shares:

New Deere Sulky and Gang
(High Lift Frame Plows)

John Deere Stag Sulky and Gang
(Low Lift Frameless Plows)

John Deere Two-Way Sulky
(Side Hill or Irrigated Land)

John Deere Engine Gangs
(For Traction Engines)

Write for the booklet above that you want and we will send it to you free.

Better Farm Implements and How to Use Them

FREE BOOK Illustrates and describes the most complete line of farm implements. Tells how to adjust and use farm tools under varying conditions. It is a practical encyclopedia of farm implements worth dollars to you—a 168 page text book.

It tells about John Deere Implements: Steel plows, cultivators and harrows; corn planters, discs harrows and beet tools; farm and mountain wagons; manure spreaders; portable and stationary grain elevators and corn shellers; hay loaders, stackers, sweep rakes, mowers and side-delivery rakes, motor hay presses; grain drills and seeders; full line of chilled plows; grain binders and corn binders; hit-and-miss and volume-governing gasolene engines.

To get this book, free, state what special implements you are interested in and ask for the book as Package No. X111

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

ORANGE DAY

March 20 is Orange Day. The world never had opportunity to eat finer oranges than this year, for California produces the finest on earth and the orange men have come through with all that has been expected of California for the great year of 1915. It is a magic year, and the quality of this year's oranges is almost magical. Growers are somewhat concerned because some fruit is puffing, but so far as the eating quality is concerned, it could not be better, and we hope immense quantities will be disposed of every day during the next year as well as on March 20, when we should each eat a dozen extra.

THE JEWELLED CITY

Saturday is the day toward which California has been working for the past five years, when its great exposition will be thrown open to the world. We are glad that one of the first events after the opening is a gathering of farmers of California to consider organizing the agricultural industry. Presumably every farmer in California will see this great exposition before December 4, which is the closing date. There is during these months no week but some event of particular importance will occur which will interest every branch of agriculture. We are glad to give in this week's issue the merest reference to some of the things which will be of interest to our readers. Let us as soil culturists go with pencil and notebook in hand and prepare to get inspiration as to the methods by which California may take a more advanced position along all productive lines. We now lead the world in many of them; let us pass our present advance.

NATIONAL ORANGE SHOW

The gates are open and the crowds are entering the greatest of all orange shows. From the very first there seems to have been a desire on the part of the weather man to show particular favors during Orange Show week. The first show held at San Bernardino was during a week of deluge when roads and even some orange groves were washed out to the ocean. We think only once or twice since has the weather man given sunny weather. As the show for 1915 opens the clouds are promising rain. The gatekeeper rather objects to this type of weather, but the orange grower knows that it means greater crops and greater prosperity, hence he spends no time in mourning over the downpour.

While the exhibits are very largely along the line of former ones, they are greater in extent and all exhibits of orchard and packing house appliances are more extended and more educational.

BEAUTIFUL BRIDGES

California never has had the experience of wallowing hub deep in blue clay roads, at least in but few sections has she ever "enjoyed" such a privilege. In "breaking up time" Back East humans were wont to imitate the woodchuck, and while not exactly hibernating were at least living on supplies laid in before the roads broke up. California roads have naturally been good, hence the good roads movement was a bit slow in getting started, but once started it has gone ahead with characteristic Western spirit. Per capita, we do not think any state in the Union can show the same extent of good roads. Many have been built by counties, a very few under the old-time road district plan, and several hundred miles by our state, and every Californian—we do not include kickers in that term—is proud of them. We are glad to give on cover page of this issue photos of some of the bridges which have been built within the last year or two years on the line of the state good roads constructed by our state highway commission. This commission has done some excellent road building and it will be the means of giving still greater popularity to the movement.

EAT POTATOES

With the price of flour marked up until it is making the staff of life very expensive living, homemakers should be interested in the household department of this week's Cultivator. European nations are urging their people to consume greater quantities of potatoes and less grain. California has plenty of wheat for its own consumption, but perhaps the European's economical methods may be of some value to us at this time. In any case there are on the household pages some most attractive looking recipes sent in by subscribers. The state produces vastly more potatoes than it can consume, and is exporting hundreds of carloads. It is not exporting as much as it should were it not for the potato tuber moth pest. However, we believe this pest will be brought under control by rigid quarantine regulations and the vigilance of the growers. In any case, let us eat more of our own products.

The next contest in the household department will be for recipes for serving rice. Rice is becoming one of California's staple products. We believe we will produce much more than at present, though we are already shipping rice to New Orleans. We hope the homemakers will send in a large supply of suggestions for serving rice. These will be given in the issue of the Cultivator of March 18.

SELLING DRAFT HORSES

At the last state fair the California Draft Horse Breeders' Association met and discussed plans for increasing the effectiveness of California farming and the profitableness of draft horse breeding through a campaign of education as to the value of better stock. Many plans were suggested and we believe some of them have been worked out. One, to a certain extent educational, was that of holding an annual sale of registered Percherons, Shires and Belgians.

The first sale has now been arranged and will be held next Wednesday, February 24, at the university farm at Davis. The association is standing behind this sale in every particular. It is not a money making proposition for the association, but is arranged so that every breeder of draft horses may take advantage of it. The association, however, has laid down certain rules, one of which is that unsound animals are barred from the sale and every breeding animal must be accompanied by a signed statement from the consignor showing its breeding ability. Veterinarians from the University of California will be present to certify to the soundness of any animal.

This makes a sale condition which is exceptional and gives a most emphatic guarantee to every patron. We hope there may be a large attendance. Further particulars may be secured by writing to Prof. J. I. Thompson at the University Farm.

ORGANIZE

We hope there will be a representative meeting of farmers at the Inside Inn at the Panama-Pacific International Exposition grounds at San Francisco next Monday at 1:30 o'clock. It is Washington's birthday and there will be great events on the grounds of the exposition. It is only the second day after the opening and it will be an excellent time for every farmer who can possibly get away to take a first look-in at the great exposition and then spare two or three hours in discussing the organization which should lead to better agriculture in California, not only from its productive, but from its marketing standpoint. There is to be outlined at that meeting an organization which we believe will give greater power to all the agricultural interests. The first thought was to make this organization one of fruit growers only, to take the place of the so-called Fruit Growers' Association which has met once or twice annually upon the call of the state horticultural commissioner. This "association" has been such only in name and has existed only as an aggregation of fruit growers who saw fit to come and participate in the deliberations of the meetings. As soon as the chairman's gavel fell at adjournment the life of the "association" ended. The good work done at these conventions should be continued, and with this in mind a committee was appointed at the last convention. In appointing them, the convention adopted a resolution favoring a larger and more inclusive association. This larger association will be discussed at the San Francisco meeting.

MARKETING COMMISSION

California is proud of David Lubin and the work of spreading agricultural intelligence which he fathered and mothered until it became a great international institution. His own country was at one time very backward in following Mr. Lubin's suggestion. Even after the king of Italy accepted his proposition and financed the International Institute of Agriculture, the United States department of agriculture was very backward about lending its sanction, and only after much pressure was brought to bear was Mr. Lubin made official representative of this nation in the institute at Rome.

The institute is proving of great value to agriculture the world over. Mr. Lubin has now suggested the adoption of a similar plan for the agricultural interests of this country. To that end there has been introduced into the national congress a resolution calling for a commission which shall have charge of gathering and disseminating this information as to conditions agricultural. The idea is that better informed farmers means more satisfactory returns. The farmer often sells his product for a price less than is justified by the law of supply and demand. If this commission will inform him regarding supply and demand, he will be qualified to deal more intelligently with those who always do have the ability to gather the information which he lacks. We believe this movement is in the right direction and hope the present bill in congress will secure sufficient support to carry it through. The subject is treated more fully in an article by Mr. Flint in this issue.

FRUIT JOBBERS

As we go to press the Western Fruit Jobbers are in session in Los Angeles. They represent men who distribute a great quantity of California fruit to retailers of the Middle West. With them, of course, are many California fruit jobbers. In one session we noted a most decided cleavage in that the Eastern jobbers were very anxious to give a severe rap to the express companies who, they feel, have entered into competition with them in the selling of fruit. It has been the custom of express companies to take orders for and deliver fruit and farm produce direct to the consumer. This has been a great advantage to many consumers and has given many producers opportunity to dispose of their fruit and at somewhat better prices than the open market would secure for them. We believe, and many on the convention floor expressed the belief, that this method is beneficial to producers and injures very slightly, if at all, the jobber. In fact some shippers of California fruits expressed most emphatically the belief that these small express orders were excellent advertisements. A representative of the Wells Fargo Express Company was present and spoke in opposition to the resolution condemning the express companies, referring particularly to Orange Day, at which time the express companies will ship hundreds and perhaps thousands of "boxes" of oranges to Eastern sections. These "boxes" will contain either one or two dozen oranges, in no sense satisfying a market, but, as the speaker expressed it, proving a tickler for large full box orders. We believe the company is right, for such express shipments mean increased business for the jobbers.

We endorse fully the statement made by Mr. James Madison of the Associated Raisin Company that the jobbers and larger fruit handling interests are too selfish, especially in that they do not consider in any way the interests of the producer. If the producer is to be discouraged, the jobber ultimately will suffer. He referred to the fact that in the marketing of raisins only ten per cent of the consumer's money goes to the producer; 90 per cent is required for packing, express transportation, commissions, and other profits. The orange men have a similar complaint though not to any such degree as the raisin men. To this argument the fruit jobbers had no reply, in fact, Mr. Madison was called to order by their chairman because technically he was not talking to the question. We believe the tactics of the larger fruit handlers can only result in lending greater encouragement to cooperative marketing. The producer must get closer to the consumer and save for both himself and the consumer some of that 90 per cent unless the fruit handlers give him a living chance.

This is one of the first conventions to be held on the coast this year and one of the many thousands which will be held before the close of the exposition. On arrival in California the 700 delegates were met at San Bernardino, shown the sights of the citrus sections of the southern part of the state, visited San Diego where two days were spent inspecting the wonders of the Panama-California Exposition, and at this writing are being shown the gardens and orchards about the city of Los Angeles, where the convention is being held. The itinerary calls for visits to Central California fruit producing sections and arrival at San Francisco in time for the exposition opening on Saturday.

Agricultural News Notes of the Pacific Coast

Northern California

A reclamation district covering over 15,000 acres is contemplated near Lone Bridge, Sutter County.

A solid train of rice made up of over 40 carloads was shipped out of Sacramento Valley recently.

Mt. Lassen is enjoying its 74th eruption. It will soon need a speedometer to record them all.

One olive grower from a little over an acre of ground in Gridley, Butte County, claims receipt of over $1,000.

The Panama-Pacific Exposition has received in excess of a thousand tons for the Chinese and Japanese exhibits.

The general rain covering all portions of the valley during last week gives assurance of hay and grain crops.

Bean growers near Yuba City are organizing a cooperative marketing association and will build a large bean warehouse.

San Quentin prison has manufactured ready for use on farms the coming season over two and a half million jute grain bags.

A flock of breeding ewes is maintained at the Davis ranch of the University of California. They are mostly of the mutton type.

Bayliss, Glenn County, was the first to organize a farm center to be ready for the farm adviser whom it is hoped may be secured soon.

Sutter County has organized a raisin growers' cooperative marketing association which will affiliate with the state association at Fresno.

Sebastopol berry growers who are cooperating in marketing their fruit are planning the construction of a large packing house and warehouse.

The California Fruit Exchange which handles deciduous fruit recently held its annual meeting in Sacramento. J. L. Nagle was reelected general manager.

The Pope Valley farm center in Napa County held a social meeting last Friday. County Farm Adviser H. J. Baade gave an interesting talk on poultry.

Newcastle, Placer County, is organizing a chamber of commerce. One of its principal objects will be to make known to the world the advantages of that section.

Glenn and Solano Counties have farm advisers now. J. W. Mills has been appointed farm adviser of Solano County and W. H. Heilemann of Glenn County.

The recent storm gave to various portions of the Sacramento Valley from two to three inches. A dozen or more inches is the precipitation generally over the valley.

The big mass meeting planned for Willits, Mendocino County, last Tuesday to agitate the farm adviser question was called off on account of the storm. The next date set for the meeting is sometime in April.

The Sebastopol chamber of commerce and the directors of the Gravenstein Apple Show Association are laying plans for the Gravenstein Apple Show this spring. M. C. Kauffmann has been elected director of the show association.

Central California

The Western Fruit Jobbers' Association visits Porterville on Friday the 19th.

Agricultural students of the Tulare high school are planning a hog raising contest.

Lindsay and Lemon Cove are planning for an exhibit at the San Bernardino National Orange Show.

Fresno County has chosen March 16 as Fresno County day at the Panama-Pacific International Exposition.

Ten thousand acres of raw land in the Corcoran district in Kings County will be planted to alfalfa this spring.

California's raisin crop last year totalled 1,800,000 pounds, or 90,000 tons. The average selling price was about four cents a pound.

A meeting of swine breeders of Kings County was recently held at Hanford and the matter of organizing a county association was discussed.

The Terra Bella Fruit Growers' Association recently held its annual meeting and decided to increase its capital stock from $10,000 to $25,006.

Salinas, Monterey County, is finding greatly increased crops because of irrigation, the practice of which has been increased greatly during the past year.

Forty carloads of condensed milk were shipped from Gonzales, Monterey County, to be sent through the Panama Canal to France. Another shipment of 20 carloads is being made ready.

County Sealer of Weights and Measures John T. Shore, of Kings County, has received his official standards and is ready for a campaign of testing weights and measures used throughout the county.

President Madison and Manager Giffen of the Associated are making addresses to raisin growers in various parts of the valley. It is proposed to make the next year the strongest ever from the grower's standpoint.

A carload of honey was shipped from Hanford, Kings County, recently. This was sent out by the Kings County Beekeepers' Association, which reports that there are about nine carloads remaining to be shipped. The price received was four cents a pound.

Merced County hog raisers have formed an association. During the past six weeks Dr. Roadhouse of the University of California has been organizing district hog associations throughout the county and it was upon his suggestion that the county association was formed.

Following a meeting of delegates interested in district fairs in the state at Sacramento the following dates for fairs have been announced: State fair, September 4-11; Pleasanton, September 13-18; Fresno, September 20-25, and Kings County, September 28 to October 2.

Over 100 farmers of the Turlock district met with the Turlock Merchants' Association recently to discuss methods of securing a better market for agricultural products of their district. It was decided to form a permanent marketing organization and to urge favorable legislation.

Southern California

One firm has contracted for 300 tons of cucumbers at Garden Grove.

Villa Park, Orange County, is shipping rhubarb in large lots to Chicago.

Stockholders of the Riverside County fair held their annual meeting last Monday.

The La Habra Citrus Association is building a $3500 addition to its packing house.

The National Orange Show is being held at San Bernardino. It will close on the 24th.

Fifteen thousand sheep are en route from Mexico to be fattened in the Imperial Valley.

Several tax payers of Orange County are petitioning for the retention of the county game warden.

Dr. Leon D. Bacheler, formerly of the University of Utah, will make special studies of diseases of walnuts.

Representative Avey of Riverside has introduced a bill providing for establishment of standards for shipment of oranges.

Farmers of Imperial Valley are being advised that until cactus plants are vastly cheaper than at present no planting be done.

Santa Barbara national forest will accommodate 8,000 cattle and horses, 300 swine and 3,000 sheep and goats, during the next season.

An effort has been made by some Southern Californians to secure an annual state fair to be held in midwinter at Exposition Park, Los Angeles.

The Federation of Women's Clubs of Riverside County is asking the board of supervisors to appoint a county forestry commission to beautify the highways.

Orange County has five sugar factories with an average of 10,000 acres for each factory. The average production is about nine tons per acre. If these figures are correct there is need of improved cultural methods.

Complaint has been made because of drivers of autos being careless in travelling over main roads of Southern California and breaking down many trellises for roses which have been put up as a bit of a welcome to our Eastern visitors.

Many settlers who have located on lands reserved many years ago at the time of the building of the Yuma dam and who have endeavored to secure filing rights through this occupancy have been ruled against by the department of the interior and will ultimately be dispossessed.

Los Angeles County has issued double its usual forestry appropriation to be used in cooperation with the United States forestry service, on condition that part of the force needed by Supervisor Charlton for cutting trails and fire breaks be taken from the unemployed applying to the county for work.

It is proposed to erect a large packing house at Cuyamaca, San Diego County, where both oranges and lemons may be packed. The present packing house in the valley handles only oranges, and the lemon growers are forced to send their fruit to the Lemon Grove house.

The Coast

Seattle importers of Chinese eggs are facing heavy losses because of the poor reception given to the inferior stock.

The Wenatchee fruit growers recently met and endorsed the North Central Washington Fruit Growers' League.

The heavy storm which recently visited the Salt River Valley of Arizona added 200,000 acre feet to the waters of Roosevelt reservoir in four days' time.

The first apples from the Northwest to go through the Panama Canal were on the Ohioan and left Portland early in December.

The Southwestern cotton committee of the United States department of agriculture has pronounced volunteer or ratoon cotton unsatisfactory.

The horticultural experts of the Oregon agricultural college are making especially strenuous efforts along the line of plant disease control.

French army officers buying horses near Burns, Oregon, have been offering only $75 to $90 for artillery horses. Horse men generally refuse to sell at such prices.

Apple growers from four apple producing states met recently in Seattle and discussed the matter of making a million-dollar loan with the growing crops as collateral.

Fruit growers recently met at Denver, Colorado, and discussed the matter of a larger cooperative marketing organization which will affiliate with fruit growers' organizations of the Northwest.

Maricopa County, Arizona, has secured for its new farm adviser James A. Armstrong, who has been farm adviser of San Diego County in California. Mr. Armstrong takes up his new work on March 1.

Eastern Oregon wool growers are expecting much longer prices next year, and some contracts are already being signed up. Growers who are holding off are prophesying wool on a 25 or 30-cent basis.

Prof. Stanley F. Morse, superintendent of the agricultural extension service of the University of Arizona, announces that a new plan will be folteslowed in conducting farmers' institutes in that state. It is planned to have lecturers spend the forenoon visiting farmers in the locality where the institute is to be held and that their talks shall have special reference to local conditions observed during these visits.

Mr. F. F. McConnell of Nez Perce, county agent of Lewis County, Idaho, writes: "In this county we are having rather a dry winter so far although there has been fair sleighing for the past two weeks. Live stock has done very well as there have been no bad storms. Most of the farmers have received good prices for their barley and wheat as most of them held for the rise. Quite a number attended "Farmers' Week" at the University of Idaho, Moscow, January 25 to 30. More winter wheat than usual was sown this fall and had the appearance, when the snow came, of producing a bumper yield next summer."

Seed Buyers

Here's What Our Guarantee Means on

$udan Grass $eed

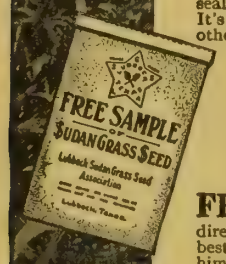
The standing and responsibility of the organization behind it is what gives a guarantee any real, acceptable value to you, and never was this so true as in the case of ***Sudan Grass Seed.*** The certificate "Inspected Seed" doesn't protect the buyer. You have to depend upon the honesty of the grower and seller of the seed.

The ***Lubbock Sudan Grass Seed Association*** is composed of Lubbock County growers of ***Sudan Grass.*** Our object is to produce and distribute to farmers genuine Lubbock County Sudan Grass Seed. The reputation of every individual member is pledged to maintain the purity and quality of all seed sold under the association's name and seal.

Our methods have the endorsement of Mr. Victor L. Cory, Superintendent, Sub-Station No. 8, located in Lubbock County, who has written:

"As chairman of the inspection committee of the Lubbock Sudan Grass Seed Association, I can assure you that the work of the committee was carefully, thoroughly and satisfactorily done. The members of the Lubbock Sudan Grass Seed Association, through their own inspection committee, made intelligent effort to see that their instructions were rigidly carried out."

Buy your seed under the protection of the association's trade-mark seal and warranty, and you will get nothing but the pure and genuine. It's the only way to keep your fields clean of weeds, Johnson grass and other pests.



BUY NOW! There won't be enough ***pure*** seed to meet the demand. Those who come late will have to take what they can get.

Put up in 1, 2, 5, 10, 25, 50 and 100-lb. packages.

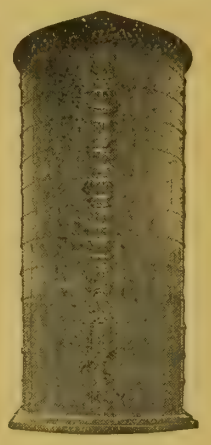
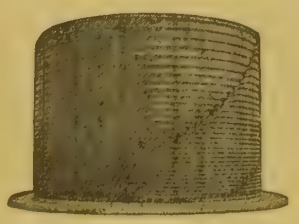
SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS

16 x 36 Redwood Stave Silo manuafactured by us for the Panama-Pacific International Exposition, San Francisco, 1915



TANKS

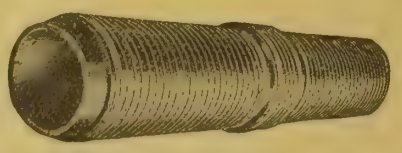


Built to order, to suit all uses and users. Cheaper than metal tanks, last longer. Won't rust. Can be taken down and re-erected without damage. Capacities, 500 to 500,000 Gallons. Towers included if you want them.

PIPE

MACHINE BANDED OR CONTINUOUS STAVE

For water supply—irrigation or power. Cheaper than any other pipe of equal size or capacity. Longer lived than any metal pipe except cast iron.



All our silos, tanks and pipe are designed by engineers to meet every condition. Made in our big factory from CLEAR, AIR DRIED REDWOOD. Selected from a stock of 40 million feet which we carry at all times.

Live Stock and Dairy

MAKING AND FEEDING SILAGE

SILAGE during the last three decades has come into general use throughout the United States, especially in those regions where the dairy industry has reached its greatest development. Silage is universally recognized as a good and cheap feed for farm stock, and particularly for cattle and sheep, are the observations made in Farmers' Bulletin 578 of the United States department of agriculture.

Silage is the best and cheapest form in which a succulent feed can be provided for winter use, continues the bulletin. An acre of grain can be placed in the silo at a cost not exceeding that of shocking, husking, grinding and shredding. Crops can be put in the silo during weather that can not be used in making hay or curing fodder, which is an important consideration in some localities.

A given amount of corn in the form of silage will produce more milk than the same amount shocked and dried. There is less waste in feeding silage than fodder. Good silage properly fed is all consumed and in addition very palatable. Like other succulent feeds it has a beneficial effect upon the digestive organs, and some stock can be kept on a given area of land when it is the basis of the ration.

On account of the smaller cost for labor, silage can be used for supplementing pastures more economically than soiling crops, unless only a small amount of supplementary feed is required. Converting the corn crop into silage clears the land sooner than if the corn crop is shocked and husked, and because of these advantages silage in the general opinion of dairy farmers has increased milk production per cow and has increased profits per acre.

Corn

In all parts of the United States where the silo has come into general use the principal silage crop is corn. One reason for this is that ordinarily corn will produce more food material to the acre than any other crop which can be grown. It is more easily harvested and put into the silo than any of the hay crops, such as clover, cowpeas, or alfalfa.

Furthermore, corn makes an excellent quality of silage. The legumes, such as clover and alfalfa, are liable to rot unless special care is taken to pack the silage thoroughly and force the air out. The only objection which has been raised concerning corn silage is the fact that it contains insufficient protein to fully meet the requirements of animals to which it may be fed. The best variety of corn to plant is that which will mature and yield the largest amount of grain to the acre, since the grain is the most valuable part of the corn plant. The variety commonly raised in any particular locality for grain will also be the most satisfactory to grow for silage.

Cultivation and Yield

In some sections it is a common practice to plant the corn a little thicker when raised for silage than for grain. Weeds should be kept out or they will be cut with the corn and may impair the quality of the silage. The amount of silage that can be obtained from an acre of corn will vary from 4 to 20 tons or more. A 50-bushel per acre crop of corn will yield about 8 to 12 tons of silage per acre, depending upon the amount of foliage and stalk that accompanies the ear. Southern varieties of corn as a rule carry a larger proportion of the plant in the form of stalk and leaves than do the northern-grown varieties. Corn should be harvested for the silo at about the same time that it is harvested for fodder.

Sorghums

Sorghums, both saccharine and non-saccharine, are readily made into silage. On account of their superiority to corn as drouth resisting crops they are more commonly grown in those regions of the West where the rainfall is too light or irregular for a good growth of corn. It is important that the sorghums be harvested at the proper stage of maturity if the best results are to be secured. A mixture of corn and sorghum has proved satisfactory in some localities where the rainfall is so variable as to make the corn crop uncertain.

Cowpeas, Alfalfa, and Soy Beans

Cowpeas, alfalfa, and soy beans can be successfully made into silage by exercising precaution. They should be cut at the same time as for haymaking. However, it is ordinarily preferable to make them into hay rather than silage. The fermentations which take place in silage made of legumes cause a greater loss of nutritive material than with corn silage. Corn husks and pea vines from canning factories, beet pulp and other by-products are also used in certain localities for filling the silo.

Corn for the silo can be cut either by hand or by machine. Hand cutting is practiced on farms where the amount of corn to be harvested is so small as to make the expense of purchasing a corn harvester too great to justify its use. Hand cutting is slow and laborious and there are probably few localities now where the purchase of a harvester would not be a profitable investment.

There are on the market several makes of silage cutters that will give satisfaction. The capacity of the machine to be purchased is an important consideration which should not be overlooked. Many persons make the mistake of getting a cutter which is too small, thus making the operation of filling the silo very slow and interfering with the continuous employment of the entire force of men. It is better to get a machine large enough so that every one will be able to keep busy all the time. The larger cutters are equipped with self-feeders, a labor-saving device which the smaller sizes lack.

The usual length of cutting varies from one-half to one inch. The latter is considered a little too long, since pieces of this length will neither pack so closely in the silo nor be so completely consumed when fed as will the shorter lengths. On

the other hand, the longer the pieces the more rapidly can the corn be run through the cutter.

In case the corn has become too dry or ripe before it is put into the silo, water should be added to supply the deficiency of moisture necessary to make the silage pack properly. Unless it is well packed the silage will "fire-fang" or deteriorate through the growth of mold. Enough water should be added to restore the moisture content of the corn to what it would be if cut at the proper stage. The water may be added by running directly into the silo by means of a hose or by running through the blower. It is claimed that by running it into the blower the water is more thoroughly mixed with the cut corn.

PIGS POISONED BY SALT

"On Saturday morning we gave to ten pure bred Poland China gilts three pounds of crushed rock salt which they ate greedily. On Sunday morning we found two of the number dead and six others in spasms from which they died during the day. The other two, being smaller, were crowded away from the trough and so did not get much, or any, of the salt. We made a post-mortem examination of two of the pigs and found nothing wrong with them except that the livers were soft.

"They have had all the charcoal they would eat and have been fed on shorts, slop, and sound corn. They were in good condition and had warm quarters. We usually keep a trough of salt before our pigs.

"I am sending a sample of the salt. Kindly advise us regarding our difficulties."

This letter came to the Wisconsin College of Agriculture. Veterinarian F. B. Hadley answers:

There seems to be no doubt but that the gilts were poisoned by the salt. Salt acts as an irritant to the stomach and bowels. Under ordinary conditions it may be placed in front of hogs even in large quantities and they will eat very little. However, if they have not had access to salt very recently they will greedily consume large quantities of it with very disastrous effects. It takes but a few minutes after eating salt for symptoms of poisoning to develop.

The hogs will first be noted to be restless. They run about the feed lot in an uncertain sort of manner and squeal more than usual. They will lie down for a moment and then jump up again and run along the fence, squealing and stamping their feet. Finally the irritation becomes more marked, the animals begin to froth at the mouth and are seized with convulsions in the course of which the muscles become rigid and the hogs throw themselves about in a violent manner. Vomiting is usually a prominent symptom. Pain becomes severe as the cases proceed. Finally the animals begin to pass into a sort of stupor. The hind parts become paralyzed and death is preceded by convulsions. In some cases a very pronounced watery diarrhea is present.

Salt is necessary for all animals and pigs in particular. It should be kept before them at all times either as rock salt or as fine salt. We prefer to mix the salt with charcoal and copperas, using 25 pounds of charcoal and ten pounds of salt and two pounds of copperas. Hogs will eat considerable quantities of this and it will do much toward keeping them in good condition.

Kings County swine raisers have organized an association.

NATIONAL LIVE STOCK

The American National Live Stock Association will hold its 18th annual convention in Hall A, first floor of the Exposition Memorial Auditorium, San Francisco, March 24-26. President Jastro writes:

"At our last annual meeting it was decided to hold our 1915 convention in San Francisco during the Panama-Pacific International Exposition, at a date to be fixed by the executive committee. It has been customary to hold our annual meetings in January, but, owing to the fact that the exposition does not open until February 20, 1915, it became necessary to fix a later date, and the executive committee, after considering the dates of other annual live stock meetings to be held early in the year, selected the above as the most convenient for the majority of our members.

"The live stock industry was never confronted with more serious problems. It is passing through a very widespread attack of the foot and mouth disease. Railroads are proposing largely to advance their rates on live stock and its products. Range conditions are yearly becoming more unsatisfactory. The cost of raising and maturing live stock has increased. Importations of meats have affected prices. The war in Europe has seriously disturbed all commercial conditions in this country.

"Among the many subjects for consideration at our convention are: Federal control of the semiarid, unappropriated, public grazing lands; various land bills before congress, administration of forest reserves, railroad rates and service, delays at terminals, cases pending before the interstate commerce commission regarding live stock rates, valuation in

Harness is like a leather boot—if you don't keep it oiled, it rots. Moisture that works into the pores of your harness robs tugs, straps and breechings of the strength they need to give you good long service.

EUREKA HARNESS OIL

keeps the pores of the leather filled with highly waterproof oils—keeps your harness soft, pliable, strong. Have your harness man dip your harness occasionally, or apply it yourself by hand. Harness costs money. It doesn't pay to neglect it.

1st Annual Consignment SALE

of Registered Percheron, Shire and Belgian Horses

Under the Auspices of

The California Draft Horse Breeders' Association

Will be Held

WEDNESDAY, FEBRUARY 24th

At The UNIVERSITY FARM, DAVIS

Sale to Commence 1 p. m.

Auction Sale of Drafters

The attention of horsemen is hereby called to the advertisement of the first annual combination sale of Percheron, Shire and Belgian horses.

This sale has been inaugurated by the California Draft Horse Breeders' Association, and is the first step towards the development of a better market for pure bred draft horses in California. It will be an exceptional sale in many respects, but particularly in the effort which is being made to protect the buyer.

In the first place, the rules laid down by the association bar all unsound horses from the sale, and every breeding animal must be accompanied by a signed statement from the consignor, showing clearly the horse's breeding ability. There will also be in attendance at the sale, a member of the veterinary staff of the University of California, who will examine any horse upon request.

These precautions will make the sale, even for the most inexperienced, a perfectly safe place to buy a horse, either in regard to soundness or breeding ability. By bringing a large selection of stallions and mares together at a centrally located place, the buyer is given an opportunity for comparison and choice not often available. This fact certainly makes this sale a good and safe opportunity to buy either a stallion or a mare at breeders' prices.

All desiring Catalogues can obtain same by writing to

PROFESSOR J. I. THOMPSON

WM. HIGGINBOTTOM, Auctioneer

Secretary California Draft Horse Breeders' Association, University Farm, Davis, California

What Those Who Know Say About Ideal Green Feed Silos

San Luis Obispo, Jan. 28, 1915.

De Laval Dairy Supply Co.,
San Francisco, Cal.

Gentlemen:—

We are anxious to tell you of the good results we are having since erecting an Ideal Green Feed Silo. The corn we put in is coming out perfect silage, no waste and good to the very edges.

This amount of feed, for as you know we erected a silo of two hundred tons capacity, is going to practically double the income of our dairy.

We raise a great amount of feed in the shape of corn on a comparatively small acreage for the silo, giving the extra land to raise grain, thus cutting the expense of mill feeds to a minimum.

We can honestly recommend this Ideal Green Feed Silo to any dairyman and firmly believe a silo will prove very beneficial and remunerative to our coast dairymen. It is an insurance policy that makes its own payments and pays the amount of the policy in a short time besides.

Sincerely,
SINSHEIMER BROS.

AN IDEAL GREEN FEED SILO WILL DO AS MUCH FOR YOU

Hard Milker

We have cows which are hard milkers. What is the best method of curing this trouble? If by slitting teats is it best to slit the entire length or how far should the knife be inserted? Would like instruction as to procedure. —Subscriber, Porterville.

The sphincter muscle that closes the opening is very small and right at the end of the teat. When it is too tight and too much pressure is required to cause the milk to flow it may be stretched by placing a dilater, shaped like a collar button, in the opening and leaving it from one milking to the next. By doing this, in time the muscle will relax and the milk flow much easier. When the dilater is left out entirely the muscle is liable to contract to its former size and the cow become a hard milker again. Some open the teat by cutting the sphincter muscle in three or four places before using the dilater. If this is not done carefully the opening may be made too large and the cow lose her milk after it. These are the methods employed and often the results are very satisfactory.

Heifer in Poor Condition

What is the cause of grubs in a heifer's back? She did not clean for a week after calving. I gave her a cup of flax seed with alfalfa and bran mash once and twice a day for a few days. She cleaned and then looked better but is still poor. Feed lima bean straw and alfalfa and bran mash once a day now. She does not give as much milk as last year when fresh with her first calf. At what intervals do cows come in heat?—Subscriber, Moorpark.

Grubs or warbles are the larvae of a fly that is much like the bot fly that bothers horses. A fairly good description of them was given in the Cultivator of December 31, on page 681, under the heading "Warbles."

Cows in good health usually come in heat every three weeks. Give the heifer the following powders for a tonic: Powdered gentian six ounces, powdered nux vomica four ounces, bicarbonate of soda six ounces and farina enough to make two pounds. Mix and give a tablespoon in the feed twice a day.

Broken Wind

Please give me directions how to treat a blocky mare that has a very deep cough. She is in good condition and seems to be all right every other way. It is not from a cold and I do not know what to do to relieve her.—Subscriber, Garden Grove.

The mare probably has broken wind or heaves. This is caused by overfeeding. You may be able to cure her by reducing the feed and giving it very regularly. Do not feed her over two pounds of hay in the morning and the same amount at noon. At night give her ten or twelve pounds of hay according to weight. Divide the grain about equally for the three feeds and every day she is not worked give no grain at noon. Also give the following powders: Powdered gentian four ounces, powdered nux vomica three ounces, powdered belladonna leaves one ounce, powdered digitalis leaves one ounce, bicarbonate of soda three ounces and enough farina to make one pound. Mix and give a small tablespoon in the feed every night.

Right-of-way

Would like to get right-of-way across one corner of my neighbor's land. I own land cornering on two sides of a stake. Land has never been fenced, now the neighbors want to fence and I must have a right-of-way out. It would probably take a piece of land 15 feet by 30 feet. Do I have to buy the land or just fence across the corner?—Subscriber, Bachelor.

As the land over which you wish to pass belongs to your neighbor you would have to purchase it from him. —L. F. S.

Questions like the above could be answered more satisfactorily by the attorney if full particulars were given. For instance, it is barely possible that a right of way has been acquired over this land by continual travel. Again, it may be impossible to secure any entrance to the property except over a neighbor's land. These facts would all have a bearing on the question.

First Mortgage

A holds first mortgage on real estate and B holds second mortgage. First mortgage is due in February. If first mortgage is not paid does the second mortgage become first and has the present owner any right to renew first mortgage?—Subscriber, Covina.

The renewal of a first mortgage does not admit of a second mortgage acquiring a prior lien upon the property. To be entirely safe it is usual to secure the second mortgagee's consent, but not necessary.

Wife's Signature

A buys land on contract with inherited money and does not consider it community property. He sells to B before he gets deed. A's wife, without his consent or knowledge, files on it as a homestead to prevent the sale and transfer. Can A give B good title without his wife signing, and if so how?—Subscriber, Strathmore.

A homestead may be selected from the community property or separate property of the husband or with the consent of wife from her separate property; this being property upon which the family are residing at the time of making and filing declaration. Thus it is apparent that A could not give clear title to his property without wife signing deed. There may be other circumstances, however, which if you will take up with your local attorney would be of assistance to you.

Promissory Notes

Three promissory notes are given and secured by second mortgage on real estate. One note is sold before due and endorsed, signed "John Doe, without recourse." Is John Doe or the mortgage liable in any way on account of the original signer's failing to pay said note?—Subscriber, Covina.

If note is endorsed without recourse the endorser is not liable thereon, but as the mortgage secures the three notes, the holder of such note would undoubtedly be entitled to an interest in the mortgage proportioned to the value of his notes to the other notes. This is very frequently the case in regard to railroad bonds, which are simply notes secured by a general mortgage.

Inheritance

Husband and wife own real estate in their own names, also hold contracts for real estate in favor of both and signed by both. Husband has father and brothers living; wife has brothers living. In the event of death of either, without a will, where would the property go?—Subscriber.

If the property is community property, upon the death of the wife it would go to the husband without administration. As to the separate property of each, there being no children, one-half goes to the surviving husband or wife and the other half to the father in case of the husband and in case of the wife in equal shares to her brothers.

Witnessing Will

Does a will have to be witnessed in this state to make it valid?—Subscriber, Covina.

A will wholly written, signed and dated in the handwriting of the testator is not required in this state to be witnessed. The other common form of will requires two witnesses.

Iowa Mortgage

Would real estate mortgage on Iowa property held by deceased party here be directed by the court here or Iowa courts?—Subscriber.

A real estate mortgage is a mere personal obligation secured by real property and its disposition would be directed by the California court.

Tricky Agent

A man sold me a desert relinquishment through an agent. The agent told the owner that I was only willing to pay $400 for the papers. The agent told me that the owner had to have $625, which amount I paid him. The agent then asked the owner for $25 commission out of the $400, which he paid him. He thus profited $250 through the deal. Can the former owner get any of this money that is due him, or could I take the matter up on the charge of obtaining money under false pretenses? Or is this a perfectly straight real estate transaction?—Subscriber.

The agent was acting for the owner and not you. The original owner could undoubtedly recover from him the extra $250 as a principal is entitled to secret profits thus made by the agent.

Settling Company's Affairs

A B & C have been in business together. The company sells out and B is settling up the business.

Reduction No.3

On Goodyear Tires

Making Total Reductions 45 Per Cent in two years To Give Always the Most for the Money

We are glad again—for the third time in two years—to announce a big reduction on Goodyear Tires, effective February 1st.

Goodyear policy on price is to give the utmost in a tire at the lowest possible profit. Our reductions are made to that end, without ever reducing the quality.

That always means, with our matchless output, more for the money than any other maker can give.

As rubber came down our prices came down. As our output multiplied, reducing factory cost, our prices came down with it. In two years our reductions—including the present—have totaled 45 per cent.

Last year we increased our output 26.6 per cent. A few days ago the embargo on rubber was modified so that supplies seem assured. The market price for rubber seems for a time established. Fabric costs less than last year. So, under our minimum profit policy, we announce this new reduction.

Only Fair Basis

We consider profit margin on a tire the only fair price basis. We keep that margin just as low as our line allows.

While we do that, Godyear tires will always undersell any tires that compare with them. That is because we have the largest output. We have a new factory, modernly equipped. And we have world-wide facilities for buying rubber, of our extra grade, at the lowest market price.

For a long, long time most tires have sold much above Goodyear prices. Some have sold one-third higher. A few have sold lower, as some always will, because of less rubber, less quality. But we can and do, under all conditions, give more for the money than any rival tire can offer.

The Best We Know

Goodyear Fortified Tires offer the best we know. They are built to give you the lowest cost per mile. They minimize tire trouble in five costly ways employed by no other maker. And they are always the same, regardless of price reductions.

Most tires will always sell higher, because of smaller output. Some tires will always sell lower because of lower standards. But we promise you that none will ever give better than Goodyear value.

This policy has made Goodyears the largest-selling tires in the world. It will make them more so as more men find them out.

Ask your Goodyear dealer for our new price on the size you buy.

Poultry for Profit

SUCCESS OR FAILURE IN 1915?

THE approach of spring is a happy season for the poultryman as well as the spring poet, but unfortunately we have too many poultrymen who confine their enthusiasm largely to these months, as do many of the sentimental writers of springtime literature. We cannot impress upon you too strongly that the poultry work is a year-round business and cannot be neglected at any season, but there are more points to be looked after at the approach of the breeding season than at any other time. You are then laying the foundation, and upon the intelligence that you use at this time largely depends your future success. Look well to your matings for 1915.

You should have by this time fully made up your mind as to the breeding pens. This work cannot be done in a day and you should have records kept throughout the year that will enable you to do away with guesswork and mate with accuracy. Now it is true that everybody cannot use the trapnest, but even the man with one pen of fowls can toe-mark and leg-band his chickens and have ways of identifying his flock so that he may do the work of mating with intelligence.

We wish to especially urge you to study the Standard and the requirements for your variety. The new Standand is now ready and your birds should be mated with that in view, as it will be the judge's guide at the poultry shows next summer and fall. Get the Standard at once and take another look at your pens to see if you can make any further improvement in your 1915 matings. We feel confident it will be the best Standard ever issued. We hope it will prove to be at least.

Don't overlook vigor or vitality in every bird in your pens. That should always be the first requirement, for without that your birds cannot retain their good shape, their brilliancy of plumage, or be good producers from any point of view. Breed from males and females that have been good producers or that have been bred from good producers. Don't forget that the egg basket is where most of the profit is and that eggs represent more than half the income from this great industry.

You should also realize the importance of hatching at least a few early chicks. The great Panama-Pacific Exposition takes place this year, and the poultry show at that place in November will be one of the largest and best ever held in this or any other country. It should be the ambition of all to breed at least a few birds good enough in age and quality to win the blue at this show. Also if you are going to exhibit at the state and county fairs you need at least some early hatched stock.

In some sections of the country February and March are excellent months to raise poultry and it is possible to produce birds that will lay eggs during the early months of fall when eggs are the highest, birds that will be in prime condition for the early show room and that will be mature enough for breeders the following season. The hatch may not be quite so good, but if you will provide comfortable quarters the chicks will be freer from disease and vermin than when hatched later in the season. Then too those birds that you wish to cull out bring a good price on the market as broilers. Reaching the market with early broilers is one method by which paying returns are brought to the specialist who raises fowls for the market.

For the above reasons and for others which might be stated we think that every farmer and every poultry raiser should have at least one good incubator holding 120 eggs or over. It is the practice of too many people to set the first hens which go broody in the spring, and these are usually the very hens which they should breed from, and they should be kept laying. These hens are the ones which had the ability to lay in winter when eggs were highest. Start the season of 1915 right and you will find pleasure and profit later in the poultry business as a result of your carefulness and common sense used at this time. —Director T. E. Quisenberry, Missouri Experiment Station.

PROFIT IN FALL EGGS

Mr. J. F. Williamson of Coalinga writes of his experience in getting fall eggs.

I read the account of Mary E. Edwards for nine months of the year; I'd like to give mine for the three months that she says chickens will not make their keep, October, November and December. I am sorry I have not the record for October as I moved in October and just commenced to keep a record the first of November.

I have 15 Barred Rock hens. In November I got 10 dozen eggs at a total cost of $2.76. The eggs were worth 50 cents per dozen here in November and December and 40 cents in January. In December I got 20 dozen eggs and in January 19 dozen. The feed averaged $2.76 per month or $8.28 for three months, and the eggs laid were worth $23.75 here on the market. They laid better in October than November, as when I moved them they quit laying for almost two weeks.

I keep the following mash before them all the time: five parts bran, two parts shorts, one part corn meal, one part oil cake, one part dried beef scrap, one-half part ground bone by measure. In the evening I fed about two and one-half pounds wheat; in the morning part of the time, sprouted barley and part of time bran, shorts and corn meal mash; about twice a week I fed green ground bone and meat together. They are still laying at the same rate. I forgot to mention that I set four hens in January, the reason for one dozen less eggs than in December, I think. From my experience chickens can be made to pay a bigger profit in October, November and December than any other months in the year.

Wise men keep out of ruts. For them there is no sameness, because they have learned to think and see and feel everything. If there is no visible sun, they draw on a reserve force of sunshine within. Some people inherit this secret source of joy; others learn to acquire and hold it.

Don't Forget

NATURAL BROODING OF CHICKENS WITH HENS

While it is still winter weather the poultry raiser is considering the raising of spring chickens for the market, and among other important problems are those of brooding. Brooding with hens, according to the United States department of agriculture's specialists, is the simplest and easiest way to raise a few chickens and is the method which is used almost exclusively on the average farm. Artificial brooders are necessary where late winter or very early chickens are raised, where only Leghorns or other non-sitting breeds of poultry are kept, or where large numbers of chickens are raised commercially.

Successful natural rearing of chickens requires convenient facilities, regular attention, and often tries one's patience, while artificial methods require a larger investment, close attention and more care, but are more commonly used where large numbers of chickens are raised. Many poultry keepers who are able to secure good egg yields and fair hatches make a failure of brooding chickens, either in raising only a small percentage of the chickens hatched or in failing to rear strong, vigorous birds which develop into good breeding stock. Brooding is still in the experimental stage, and no one system has given perfect satisfaction.

Rearing Chickens with Hens

Sitting hens should be confined to slightly darkened nests at hatching time and not disturbed unless they step on or pick their chickens when hatching, in which case the chickens should be removed as soon as dry in a basket lined with flannel or some other warm material and kept near a fire until all the eggs are hatched; or the eggs may be removed and placed under a quieter hen whose eggs are hatching at the same time. An incubator may also be used to keep the earliest hatched chickens warm in case they are removed from the nest. If the eggs hatch unevenly those which are slow in hatching may be placed under other hens as hens often get restless after a part of the chickens are out, allowing the remaining eggs to become cooled at the very time when steady heat is necessary. Remove the egg shells and any eggs which have not hatched as soon as the hatching is over. Hens should be fed as soon as possible after the eggs are hatched, as feeding tends to keep them quiet; otherwise many hens will leave the nest. In most cases it is best that the hen remain on the nest and brood the chickens for at least 24 hours after the hatching is over.

Hens are often used to raise incubator-hatched chicks and to take the place of the artificial brooder, a practice that is in operation on many poultry farms. A few eggs are put under the hen four or five days before the incubator is to hatch. In the evening following the hatch of the incubator after the chickens are thoroughly dry one or two are put under the hen, and if she is found to mother them properly then next evening as many more are added as she can brood or care for properly. Hens will successfully brood 10 to 15 chickens early in the breeding season and 18 to 25 in warm weather depending upon the size of the hen. This method of handling chickens does away with the artificial brooder, and where one has only a small number of chickens to raise it is a very easy manner in which to handle them and also a good method when it is desired to raise separately special lots of chicks. It should be borne in mind in adding chickens to a hen which already has some to brood that it is best to add those of the same color and age as the ones already with her as the hen will often pick the later arrivals if they are of a color different from the ones she is already brooding. As a rule this transferring should take place at night although with a quiet docile hen it can be done in the morning.

Powder the hen with a good insect powder before moving her and the chickens to the brood coop. The hen should be dusted every two weeks or as often as necessary until the chickens are weaned. If lice become thick on the chickens or if they are troubled with "head lice" a very little grease, such as lard or vaseline, may be applied with the fingers on the head, neck, under the wings and around the vent. Great care should be taken not to get too much grease on the chickens as it will stop their growth and in some cases may prove fatal.

The brood coop should be cleaned at least once a week and kept free from mites. If mites are found in the coop it should be thoroughly cleaned and sprayed with kerosene oil or crude petroleum. From one to two inches of sand or dry dirt or a thin layer of straw or fine hay should be spread on the floor of the coop. Brood coops should be moved weekly to fresh ground, preferably where there is new grass. Shade is very essential in rearing chickens, especially during warm weather; therefore the coops should be placed in the shade whenever possible. A cornfield makes fine range for young chickens as they secure many bugs and worms and have fresh ground to run on most of the time, due to the cultivation of the ground, and have abundant shade at the same time.

Toe punch or mark all the chickens before they are transferred to the brooder or brood coop so that their age and breeding can be readily determined after they are matured. Farmers frequently keep old hens on their farms and kill the younger hens and pullets because they are unable to distinguish between them after the pullets have matured.

Brood Coops

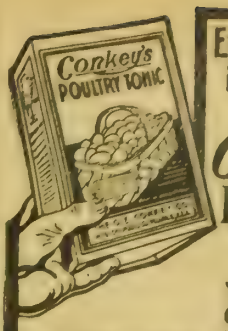
Chickens hatched during the winter should be brooded in a poultry house or shed while the outside weather conditions are unfavorable; after the weather becomes settled they should be reared in brood coops out of doors. Brood coops should be made so that they can be closed at night to keep out cats, rats and other animals, and enough ventilation should be allowed so that the hen and chicks will have plenty of fresh air. Details and specifications for building a good coop are given in the department's Farmers' Bulletin 574, "Poultry House Construction," page 13, which is to be had on application.

The hen should be confined in the coop until the chicks are weaned, while the chickens are allowed free range after they are a few days old. Where hens are allowed free range and have to forage for feed for themselves and chicks, they often take them though wet grass where the chicks may become chilled and die. Most of the feed the chicks secure in this manner goes to keep up the heat of the body, whereas feed eaten by those that are with a hen that is confined produces more rapid growth as the chicks do not have so much exercise. Then too in most broods there are one or two chicks that are weaker than the others, and if the hen is allowed free range the weaker ones often get behind and out of hearing of the mother's cluck and call. In most cases this results in the loss and death of these chicks due to becoming chilled. If the hen is confined the weaklings can always find shelter and heat under her, and after a few days may develop into strong, healthy chicks.

The loss in young chicks due to allowing the hen free range is undoubtedly large. Chickens frequently have to be caught and put into their coops during sudden storms as they are apt to huddle in some hole or corner where they get chilled or drowned. They must be kept growing constantly if the best results are to be obtained, as they never entirely recover from checks in their growth even for a short period. Hens are usually left with their young chicks as long as they will brood them, while some hens frequently commence to lay before the chickens are weaned.

Tells why chicks die

E. J. Reefer, the poultry expert of 405 Main St., Kansas City, Mo., is giving away free a valuable book entitled "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.



Every Month in the Year you can use **Conkey's POULTRY TONIC** for Young Chicks Growing Stock Molting Fowls and Laying Hens and *Every Bird Will Be The Better for it*

Vigorous birds grow rapidly, feather up fast, and pay a profit, while the weak ones drag along and are only an expense.

CONKEY'S gives them health and stamina and keeps the organs keyed up to their best without overtaxing them.

Don't just say "Poultry Tonic" to your dealer. Say "CONKEY'S" and know you are getting pure tonic, absolutely free from filler or cayenne. Buy it by the Pail, and use every day.

CONKEY'S WHITE DIARRHEA REMEDY in the drinking water from the start, may save many of your chicks—a splendid preventive of White Diarrhea—25c. and 50c.

Send 4c in stamps for Conkey's Poultry Book. It tells facts you want to know. Worth dollars to any poultry owner.

LEGAL QUERIES

(Continued from Page 211)

A has borrowed from the company. B owes A a sum of money of which he has paid all but $430, and this he refuses to pay, claiming that he has counter claim on A for the amount, through company. Can A make him pay the $430?—Subscriber.

Unless B is the holder or purchaser of the claim of the company against A he cannot offset that amount against the claim of A. The above qualification is made in view of the statement that the company sells out.

Lapsed Contract

I have a contract with the water company in which it is stipulated that if the water rent is not paid it becomes null and void. My crops were damaged because of seepage from canals and ditches of the company. This was four years ago. The company refused to pay the damage and I have not used water during that time. Now should I wish to use the water under this contract can the company make me pay delinquent assessments for the four years in which I did not use the water?—Subscriber, Laton.

The usual case when parties stipulate that upon default in payment contract becomes null and void is upon the happening of the conditions; the contract thereafter conveys no rights. If the company refuses to deliver you water except upon payment of delinquent assessments, if it is a public utility, it would be advisable to take matters up with the railroad commission. It is impossible to give you a more definite answer without seeing the contract or knowing more about the company.

Trust Deed

Trust deed held against my place is due next month. Holder has agreed by letter to extend the time. Is that all that is necessary or could he take advantage of me if he was so inclined? What would be the course to pursue to collect?—Subscriber, Los Angeles.

The usual course upon a trust deed is for the holder of the note secured thereby to order the trustee to publish notice of sale, after which sale the trustee gives deed to the property to the purchaser, crediting upon the note amount of the purchase price. If you should notify the trustee of the communication which you have it is very probable that no action will be taken upon foreclosure.

Property In Wife's Name

If I buy a piece of property and put same in my wife's name could children by a former marriage make any trouble?—Subscriber.

The best method would be to make a gift deed of property to your wife.

Second Mortgage

I hold a second mortgage. Interest has not been paid for a year and a half and no principle has been paid. Mortgage is in three notes, payable in one, two, and three years. The third note is due the 20th of this month. Will it be necessary to do something to protect my interests when my last note is due? Is there anyway by which I can collect other than by taking up the first mortgage and then foreclosing? The property has changed hands four times since I took the mortgage. The maker of the notes and at least two of the subsequent owners are individually able to pay the mortgage.

A mortgagee can always bring action to foreclose his mortgage, and in case of second mortgage the property is sold under foreclosure sale, subject to the lien of the first mortgage. For any amount remaining unpaid upon the mortgage a deficiency judgment may be entered against the maker of the mortgage and all parties who have assumed the payment thereof; which deficiency can be satisfied as in any judgment. The only case in which the second mortgagee is obliged to take up the property is when he is unable to exact payment from the debtors and must look solely to the property for his security. In other words, it is a practical proposition and not a legal one.

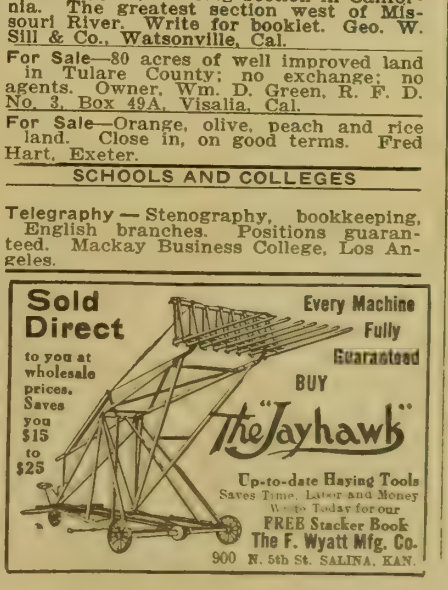
SCHOOLS AND COLLEGES

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.



PANAMA-PACIFIC EXPOSITION

(Continued from Page 195)

grade of his herd so that he may get more butter fats in proportion to the feed which his herd consumes.

The methods of manufacture from raw rubber, grains, cocoa beans and hundreds of other agricultural products to the finished articles of trade are carried on.

As a supplement to the working machines there are hundreds of moving picture exhibits operating continuously to show methods of production.

In the palace of horticulture are shown the wonderful flowers and growths of the equatorial region. The dome of this palace is the biggest glass dome in the world, and under its spread are hundreds of specimens of dates, palms, bananas, bread fruit trees, orchids, and all tropical and hothouse plants and flowers.

Here are also a great many working exhibits. The National Canners has an educational exhibit where all fruits and vegetables will be canned in season. A battery of 14 canning machines is also shown in operation. In the Oregon exhibit there will be a home cannery in operation. At all of these exhibits the formulae used and the methods will be fully shown and explained by the experts attached.

There are a number of packing houses in operation which will give every one the chance to see how the fruits are handled which top the Eastern markets every year.

An integral part of the horticultural exhibit is to be found in the wonderful gardens which surround the building. These gardens have been planted to show the specialties of each nation, and many seed firms have planted plots with flowers which they themselves have originated through selective methods.

The exposition grounds are one huge garden with the paths and roads lined with trees from all over the world which have been transplanted and are now beautifully green and flourishing. The acres of flower beds have been planted to flowers and shrubs so that every day in the year they will be in full bloom. All of the spaces not used for buildings or roads, paths or flowers, have been planted to lawns.

The live stock show is particularly noteworthy because arrangements have been made to keep typical herds in the barns during the whole period of the exposition. These view herds are composed of typical animals in the different breeds.

There are nine stock shows scheduled for the fall for which premiums have been offered in an excess of $500,000.

There are many other features scheduled in this department, among which can be mentioned the horse racing, polo, bird and sheep dog trials, sheep shearing and wool grading contests.

THE WALNUT INDUSTRY

(Continued from Page 199)

the older or bearing trees will be cut out to make room for a better paying crop.

Comparing crop figures with those for acreage, it would appear that a good crop in the state allows only about one-third ton of nuts per acre. If this be so, it is not a very good showing, and yet it is the best which the most reliable figures on hand justify us in making. And in this case we must assert that there is considerable walnut acreage somewhere in the state which does not bring proper returns to the grower.

In a good crop year the yield should not be less than one ton to the acre. Some orchards are doing as well as this; some few are doing better. But the majority of orchards fall far below what should be the average yield.

Although the price for walnuts in the last few years has been good it is evident that walnut growers are not in the get-rich-quick line. Whoever would make a success of a walnut orchard must have the right start in conditions of soil, climate and variety, and then must give such careful attention to fertilizing, cultivating, and watering as will assure him the largest crop possible.

Be A Producer

Don't waste your time. Spend it in your garden. The European war has caused a tremendous demand for American products, and has boosted all foodstuffs. In the midst of this high cost of living, your small ranch, back yard or old corral lies unproductive. A few cents in seeds will produce dollars for you in vegetables, and a wealth of bloom.

We offer the highest quality of seasonable seeds bought by our corps of experts, and tested at our famous Trial Grounds in our latest and best innovation

MADE TO ORDER
FEBRUARY
GARDEN COLLECTIONS

Not the ordinary seed collection, but a collection to be selected by yourselves from a large variety of seasonable vegetable and flower seeds, plants, trees, insecticides, etc. We offer these collections at a reduced rate of 1½ to 1, for instance, $1.50 in seeds for $1.00, and as high as $75.00 in seeds, etc., for $50.00. We make this extraordinary offer because the observance of a few labor saving conditions enables us to give you the benefit of this saving.

With every order we will mail you our beautiful illustrated catalogue, which is so full of planting and cultural directions as to earn the title of the

LOS ANGELES, CALIFORNIA

Why
You Should Buy
STILETTO

STILETTO tools are keener and better tempered, STILETTO tools work better and last longer, STILETTO garden and farm implements are longer lived, run easier and more satisfactorily, STILETTO paint goes farther and wears better and that word STILETTO spells quality and confidence, first, last and always.

If you do not know where STILETTO goods are sold write us and we will give you the name of the nearest STILETTO dealer.

Pacific Hardware & Steel Co.
701 Townsend St.
SAN FRANCISCO, CAL.

Alfalfa Seed

Every field where Seed we offer for sale was grown in 1914 was thoroughly inspected by us for dodder, noxious weeds, etc., before it was harvested.

Everything we offer has been government tested to make our assurance doubly sure, both as to germination and foul weeds.

We are actually offering California's best product.

If you are looking for cheap, unreliable stuff, you will have to look elsewhere, but if you want good seed at an honest price we can serve you.

Samples, prices, etc., on application.

V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.

The only exclusive Alfalfa Seed Dealers in the West.

When writing advertisers, mention The Cultivator.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pigeon Paper and Association

Is there a paper published on the Pacific Coast devoted to pigeons and squabs? Will you kindly give me the address of the Pacific Utility Pigeon Association.—Subscriber, Calipatria.

There is no pigeon or squab journal published upon the Pacific Coast today. Until recently there was one published in Oakland, but it has been transferred to Kansas City, Missouri. The address of the Pacific Utility Pigeon Association is 1014 Fruitvale Avenue, Oakland, and its manager is Mr. Wm. Gabrielson.—R. V. M.

Milo Maize

Will you kindly tell me if sorghum and millet are of value for fattening cattle? What is their value compared to alfalfa?—Subscriber, Alpaugh.

Milo maize is used rather more than the sorghum or millet. We do not know of any extensive use of millet, but in the Imperial Valley the growth of dwarf milo is very general. Stock are not only given access to the fodder but are fed the heads. A few growers have preferred cutting the heads, threshing and grinding, but it is generally considered that this does not give enough better results to justify the additional expense. As to comparison with alfalfa, we think if you are fitted to grow the alfalfa that it would give far better returns per acre.

Silo and Ensilage

I have a wooden tank 30 feet across with sides eight feet high and three inches thick. Could I change this into a silo? Would two small ones be better than one large one? Also, is ensilage good for hogs in winter? How large a silo would be required for about 50 hogs and ten cows?—Subscriber, Yermo

We do not fully understand the subscriber's desire. If it is to use the tank as at present constructed, it would have no value. That is, instead of being 30 feet across and eight feet high the dimensions should be exactly reversed. Possibly the subscriber means to reconstruct entirely and make a silo of material now used in this tank. Only examination of the material could determine the advisability of so doing. One of the prime factors of a successful silo is that it shall be small enough in diameter so that it may be fed down at least two inches per day. Otherwise, as soon as the silo is open the ensilage quickly spoils and with the number of head of stock which the subscriber has he would need only a comparatively small silo. For ten cows about the smallest size should be 12 feet in diameter and 24 feet deep. This would hold 48 tons. We are not certain how much the 50 hogs would require per day and we ask any of our subscribers who have had experience in feeding ensilage to hogs to inform us on this point.

Grafting Walnuts

I have two large native black walnut trees. The limbs are from four to eight inches in diameter, and are very healthy trees. Is it advisable to graft or bud into English walnut?—Subscriber, Santa Cruz.

Such trees can be successfully grafted to English walnuts but the process is expensive when undertaken on very large trees. It is not advisable to graft in branches larger than three inches in diameter because of the difficulty of preventing decay at the place where the scion was inserted. This necessitates going well out on the branches and the placing of a large number of scions. It will also be necessary to erect a scaffold from which the operator can work when scions have to be placed in branches more than 15 feet from the ground. This scaffold should be left in place the first season as it will be convenient in examining the waxing of the scions and in tying the new growth to the supports. All places where branches have been cut off and where scions have been inserted should be painted every year until fully grown over. This paint can be either a heavy metallic paint or a covering made by dissolving asphaltum in gasoline.—J. B. N.

Pecan Nuts Not Filling

In planting pecan trees is it necessary to plant male and female trees or does each tree have perfect blossoms? Why do the nuts on some fail to have meats in them?—Subscriber, Escondido.

The pecan has perfect blossoms, and it is not therefore necessary to plant more than one tree to get fruit. The reason for some nuts failing to fill is, perhaps, due to imperfect pollenization from some local cause which might occur in one variety and not in another, and the remedy would be to discard such and plant varieties which do mature. It is also a fact that the pecan generally in California does not mature well near the Coast, as it seems to require more heat in summer, as well as abundant root moisture. Varieties more suited to Coast conditions may be found or originated later.—Leonard Coates.

Lice On Hogs

Is there a dip or a spray which will eradicate lice on hogs?—Subscriber, Yermo.

There are several dips on the market offered to stock raisers which we believe are generally satisfactory, especially any of the coal tar preparations. These may be purchased and used in the regular dipping vat or, as is more often done, sprayed over the stock. In spraying use particular care to spray back of the ears and along the neck and under the breast. At the same time clean up the pens and surroundings which are breeding places for more of the same kind of pests. While spraying rub vigorously with the broom. The large spray pumps which deliver the spray with considerable force are to be preferred. Don't be afraid of the dip or the spray but administer it often. These dips or sprays come under various names such as chloronaphtholeum, zenoleum, Lincoln dip, carbolic dip, creso, etc. A two or three per cent solution of creolin or the common tobacco dip is also efficacious.

Pruning Orange Trees

What is the best time to prune and fertilize orange trees? We have large amount of cow manure.—Gardener, El Monte.

Probably the best time to fertilize orange trees with cow manure is whenever it may be gotten. That is, we would put it on at any time of the year. This is one of the best times. With commercial fertilizers a limited application of nitrate of soda within the next month and another a month later, with phosphoric acid and potash still later, would probably be about right. As to pruning, we would prune as soon as the crop of oranges is off.

On Shares

We are repeatedly asked as to division of shares in renting a farm. As a general thing in the East the rental proposition considers the three factors of land, labor, live stock and equipment, and each of these on the same basis. The quality of the land, nearness to market, and many other points are of course factors. On this basis, if the land owner furnishes the land, the live stock and equipment, the division of proceeds is on two-thirds and one-third basis. We submitted this question to the state university to learn as to California practice and from Mr. V. C. Bryant of the division of agricultural extension we have the following:

"As to fair proportion of the crop where barley is put in on shares I will state that this depends somewhat upon the type of soil. Generally speaking, if the soil is fairly good and the tenant furnishes the seed, the owner receives about one-third of the crop for the rental of the land. Where the soil is not quite so good, as in some parts of the Sacramento Valley, the owner only receives one-fourth of the crop for rental of the land. I think that one-fourth is a little more general than one-third. Where the landlord furnishes the seed, the tenant does all the work and gives one-half of the crop for rental of the land."

More Katydid Eggs

I enclose twig from peach tree containing some kind of eggs. What are they?—Subscriber, Laton.

Katydid.

Garden Crops

I have about ten acres in the foothills of Fresno County where I picked ripe tomatoes in March last year. About two or three acres of this land is located where the air is so warm that oak trees do not shed their leaves for two years. This year they have a new growth now at the end of January. I send you leaves. The soil is a dark gray granite, four to eight feet deep. Would like to know what to plant as a permanent crop and what is the best early vegetable?—Subscriber, Orange Cove.

We believe that with such land we would not plant trees but would continue to raise tomatoes and other vegetables. Potatoes might have been planted a month or two ago and given exceptionally early crop which would bring long prices. Strawberries, raspberries and other crops of that nature would grow fine winter crops. Of course, nearness to market, which is now largely a matter of good roads, is a factor in determining just what should be grown. The leaves sent with fresh young buds just starting new growth indicate practically a frostless belt.

Breeding Doe

Can you inform me how soon after kidding a doe comes in heat again? I have been informed that goats that kid in the spring will not breed again until the following fall.—Subscriber, Pasadena.

If a doe kids before February she may come in heat about three weeks after kidding, but should she kid later the chances are she will not again come in heat till July, August or September. Our experience teaches it is best not to breed a doe more than for one kidding a year, which was apparently the way intended by nature.—Winthrop Howland.

Alkali Ground

We are planning to plant 300 fruit trees on alkali ground. It is black alkali, all on top of the ground. From a foot down the soil is sandy loam with no alkali in it. Water has been standing on the top of the ground and the alkali has all come to the top. Should we dig a large hole for the trees and haul in other dirt and put around them? Is gypsum good to put around roots of trees when planted? What is the best kind of fruit to plant on alkali ground?—Subscriber, Lemoore.

The subscriber has apparently some subsoil other than sandy loam, for with sandy loam and plenty of water one could soon wash away any ordinary alkali, even if it is black alkali. It is probable that this sandy loam is underlaid with an impervious hardpan. A good deep soil investigation is probably the only way to determine best method of handling. If the land is very valuable drainage, which would permit washing out the alkali, would be the surest and most satisfactory. The application of a great quantity of gypsum will change

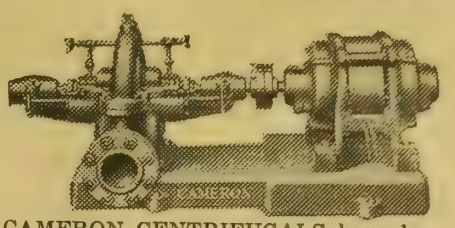
CAMERON IRRIGATION PUMPS



For the continuous and exacting work in irrigation pumping, you want pumps that are simple and dependable with the least attention.

CAMERON CENTRIFUGALS have been designed and built with the special aim of producing a combination of high working value and low operating cost. Simple and strong all through. Finest material and workmanship. Highest efficiency. Backed by an experience of over fifty years. Can be operated by motor, gas engine or belt.
Put your pumping problem up to us. No obligation.

THE AUTO-OILED WINDMILL WITH DUPLICATE GEARS RUNNING IN OIL

Every bearing is constantly flooded with oil. Two quarts of oil in the gear case of this 8-foot auto-oiled windmill will keep the gears and every bearing flooded with oil for a year or more.

The galvanized steel helmet covers the gears, keeps out rain, keeps out dust, keeps in oil. The mill needs oiling but once a year.

There is a windmill, known the world over as "the windmill which runs when all others stand still." This new windmill with gears and bearings flooded with oil runs in much less wind than that well known windmill.

The two large gears, which lift the load straight up, are each independent of the other and each is driven by its own pinion on the main shaft and must take its half of the load at all times. The auto-oiled windmill, with its duplicate gears and two pitmen lifting the load straight up, is unbreakable. Every 8-foot mill is tested under a pumping load of 3000 pounds on the pump rod. For the larger sizes the load is proportionately greater. We know that every one of these windmills is unbreakable. We venture the assertion that this is the most nearly perfect, best made, best tested, best oiled, most nearly perpetual, automatic and self-sufficient of any machine of any kind ever made for farm work and the most nearly fool-proof. There is no friction on any part of the furling device when the mill is running and very little when the wheel is furled.

DUPLICATE GEARS RUNNING IN OIL
Oil Annually
EVERY BEARING FLOODED WITH OIL

A small child can easily furl this windmill or an automatic regulator can take care of it. One of these mills has been furled 10,000 times in one day by a man on our premises—more times than it would ordinarily be furled in 30 years of service. A band brake, of the automobile type, is used, and it always holds.

The gear case contains two pairs of gears and the supply of oil. From this gear case the oil circulates to every bearing in a constant stream. It flows out through the friction washers in the hub of the wheel and is automatically returned to the gear case. Not a drop of oil can escape. It is used over and over. So long as there is any oil in the gear case the gears and every bearing will be flooded with oil.

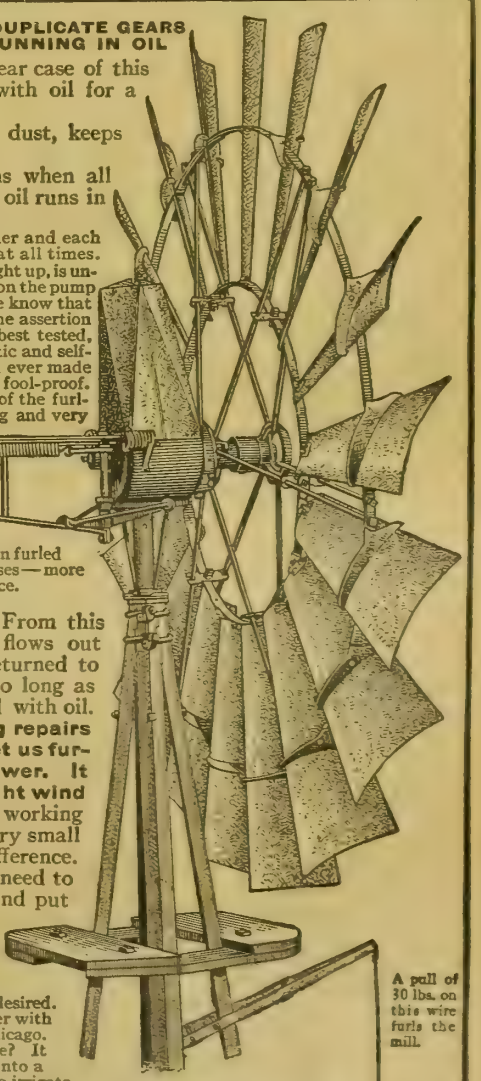
If you are tired of climbing a windmill tower; if you are tired of buying repairs and having them put on; or, if you are tired of waiting for a big wind, let us furnish you an unbreakable, self-oiling, ever-going mill to go on any old tower. It costs but little and you will get the difference between no water in a light wind and an abundance of water in almost no wind. The flooding of all the working parts with oil, the perfect balance of the wheel and vane on the tower, the very small turntable on which the mill pivots and the outside furling device make this difference.

Now there is no objection to a high tower. Have as high a tower as you need to get wind. You don't have to climb it. Your dealer can come once a year and put in oil, if needed, and inspect the mill.

Running water purifies itself—stagnant water, standing water, collects and retains impurities. If you pump from your well constantly all the water it can spare, the water that comes in to take its place will be pure. If the water in your well stands until you happen to want some, and you pump but little, then it is likely that surface water will flow into it and carry in impurities. The unsafe well is the one that has standing water. A flowing stream is the thing to be desired.

The auto-oiled windmill makes all this possible as it can run from one year's end to the other with practically no wear and no cost. If interested, write Aermotor Co., 1146 So. Campbell Ave., Chicago. Why not have flowing water, cool in summer and warm in winter, always fresh and pure? It will cost next to nothing. It will give health to your family and stock. Let the water run into a good size reservoir and raise all the fish of the choice kinds your family can eat, and have water to irrigate your garden and make it raise many times as much as it would otherwise. Water costs nothing. Use it. To let it stand is to abuse it.

We need and must have the best dealers everywhere. They need us if they are going to remain in the windmill business. Write right now.



A pull of 30 lbs. on this wire furls the mill.

Mr. Farmer
do you want a
Real Tractor?

One that will do all your work: Plow your land, cultivate, harrow, disc, make furrows for irrigating, grade the roads, haul your wagons on the road, pump water, run threshing machines, saw wood, etc.

The Improved Lambert Steel-Hoof Tractor
is the greatest labor and time saver known.

Send for printed matter or better still call and see the Lambert Tractor.

WM. GREGORY & SONS
602-606 N. Main St. LOS ANGELES

the black alkali into white or sulphate of sodium instead of carbonate and that is more soluble in water and more easily washed out of the soil. The alkali does not come up because of standing water, but usually because of evaporation of moisture during the summer season, bringing with it a large quantity of the salt which destroys the plant growth.

LEGAL QUERIES

(Continued from Page 214)

Chickens Trespassing

I have requested my neighbor to keep his chickens at home, but he fails to do so. Can I spread poison and let him take the consequences? What recourse does one have against chickens?—Subscriber.

Every person who willfully exposes any poison with intent that some shall be taken by an animal is punishable by imprisonment in the state prison or county jail. The best method would be to take action against your neighbor for the damage caused.

Removing Boundary Stakes

A has his line surveyed and stakes set by the county surveyor. B removes the stakes? Is that a criminal offence?—Subscriber.

Every person who maliciously removes any monument erected for the purpose of designating any point in the boundary of any lot or tract of land is guilty of misdemeanor.

Adopted Child

Does an adopted child share equally with own children in property left by parents? If a husband dies leaving property, what share does his wife get, also what share does a husband get of his wife's property at her death?—Subscriber.

After adoption, the person adopting and the child adopted sustain towards each other the regular relation of parent and child and have all the rights and are subject to all the duties of that relation. Upon the death of the husband without issue the wife takes one-half of the community property and one-half of the separate property. Upon the death of the wife without issue, the husband takes all community property without administration and one-half of her separate property.

Damage From Flood Water

Would I have any cause for suit for damages against city on account of flood water which could have been prevented? I was forced to move out with my family and lost chickens, hay, vegetables, etc., and the damage to the premises is considerable. I am forced to rent until I can get my place cleaned up. The city authorities were aware that said premises were subject to flood water, but refused to do anything to prevent it.—Subscriber.

Municipal corporations are bound to provide for the escape of surface water in all that class of cases where the surface water, owing to the conformation of the adjacent country, has formed for itself a definite channel in which it is accustomed to flow. There are usually so many other circumstances such as charter provisions, change in grade of streets, that it is impossible to give a more definite answer.

Inheritance Tax

Is inheritance tax only on real estate? Man dies without will, leaving as only heirs six children of deceased brother and one child of deceased sister. Will the brother's wife, mother of the six children, receive any share of the estate?. Are the laws of Illinois and California the same governing such estates?—Subscriber, Woodland.

The inheritance tax law of California applies to all property real or personal. Other states have various other laws and some have none. The property in this case would go in equal shares to the brothers and sisters and they being dead to the children or grandchildren by right of representation; that is to say, one-half to the children of one sister and the other half to be divided among the six children of the brother. The mother of the children should apply for letters of guardianship and will be entitled to have the children maintained out of their own estate.

BREAD MADE WITH 30 PER CENT POTATO MEAL ACCORDING TO AUSTRIAN IDEA

Baking experiments to test the value of making bread of potato meal mixed with wheat flour are now being undertaken by the United States department of agriculture's bureau of chemistry. This is to test the possibilities of the potato in the same manner as Germany and Austria are now advising their people to do. The increased cost of living throughout the world has emphasized the fact that flour made of other substances than wheat, or of these substances mixed with wheat, might provide people with healthful food quite as nutritious as the pure wheat flour and at the same time cheaper.
